What is Security?

“Treat your password like your toothbrush. Don't let anybody else use it, and get a new one every six months.”

- *Clifford Stoll*

“If you think technology can solve your security problems, then you don't understand the problems and you don't understand the technology.”

- *Bruce Schneier*

Security Goals – Security Triad

Confidentiality

Integrity

Availability

CIA - equal
weightage?

CIA –
applications?

Confidentiality

“Information is not disclosed to any parties other than the intended recipients.”

- Security mechanisms:
 - cryptography
 - access control
- Detection of a breach of confidentiality is very difficult in the digital world, sometimes impossible.

Integrity

“Protection against unauthorised modifications to the data or the system”

- Security mechanisms:
 - cryptography (hash/MAC)
 - error detection/correction codes, checksum
 - establish procedures for system operation, maintenance and administration.
- Integrity violations can be detected most of the time.

Availability

“The information and system resources are available to the legitimate users”

- Security mechanisms:
 - redundancy
 - fault tolerance and resilient system design
- Attacks against the availability of a system are known as ‘Denial of Service’ attacks (DoS)
- High availability is very expensive
- e.g., Single point of failure -> high availability.
- e.g., Business continuity -> mission critical applications or systems.

Authentication

“Provides the means to verify the identity of an entity”

- An entity can be a person, a computer, or any object on the network, including data.

Authentication

3 factors:

- 'what you know' – passwords, passphrases, etc.
- 'what you possess' – badges, smart cards, tokens.
- 'what you are' - biometrics

What you know

What you have

What you are

Non-Repudiation

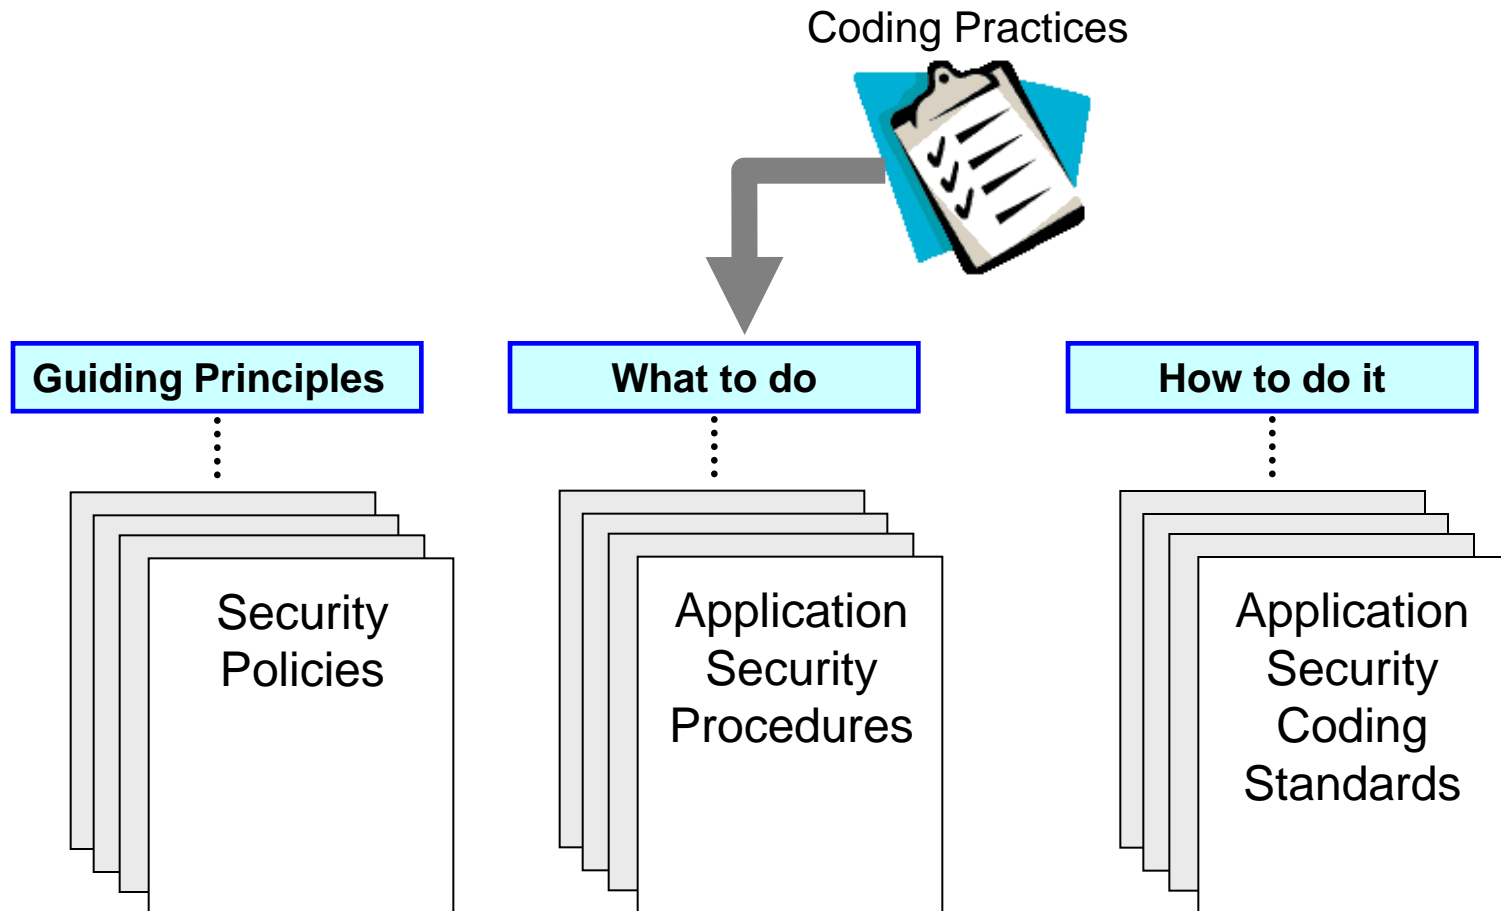

“An entity cannot deny of performing some action”

- Non-repudiation of origin
 - A sender cannot deny that he sent a message
- Non-repudiation of delivery
 - A receiver cannot deny that he received a message

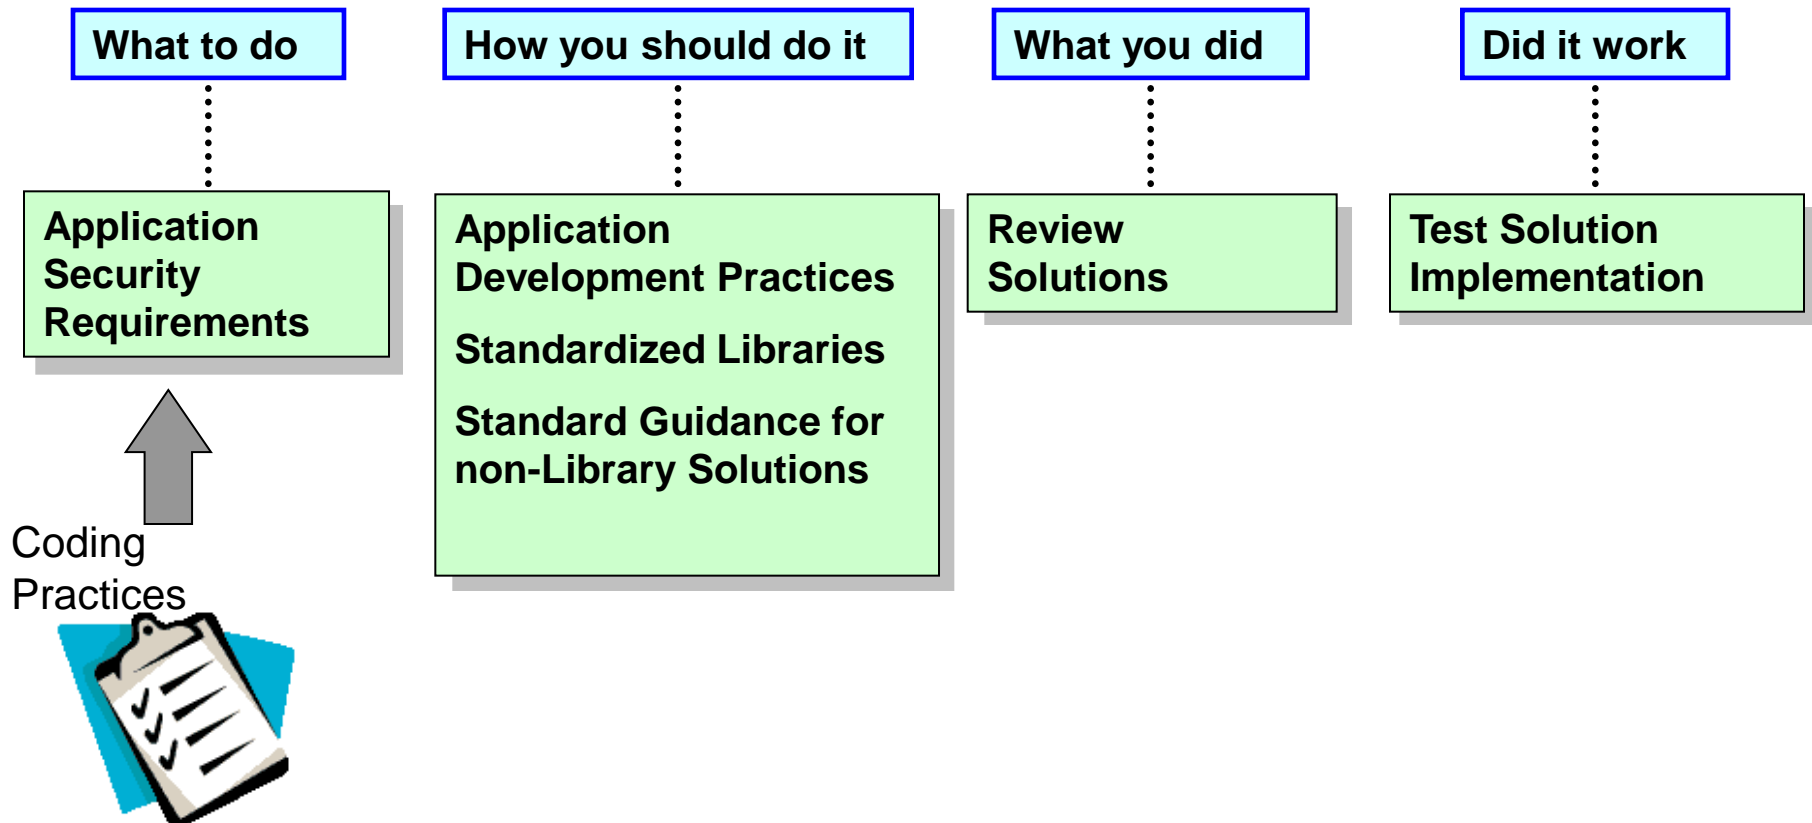

Secure Coding/Programming

- Practice of developing computer software
 - that guards against the security vulnerabilities.
- Defects, bugs and logic flaws are
 - the primary cause of commonly exploited software vulnerabilities.
- Most vulnerabilities stem from
 - a relatively small number of common software programming errors.
- Identify the insecure coding practices
 - and educating developers on secure alternatives.

Support Secure Development Lifecycle

Threat, Vulnerability, and Attack

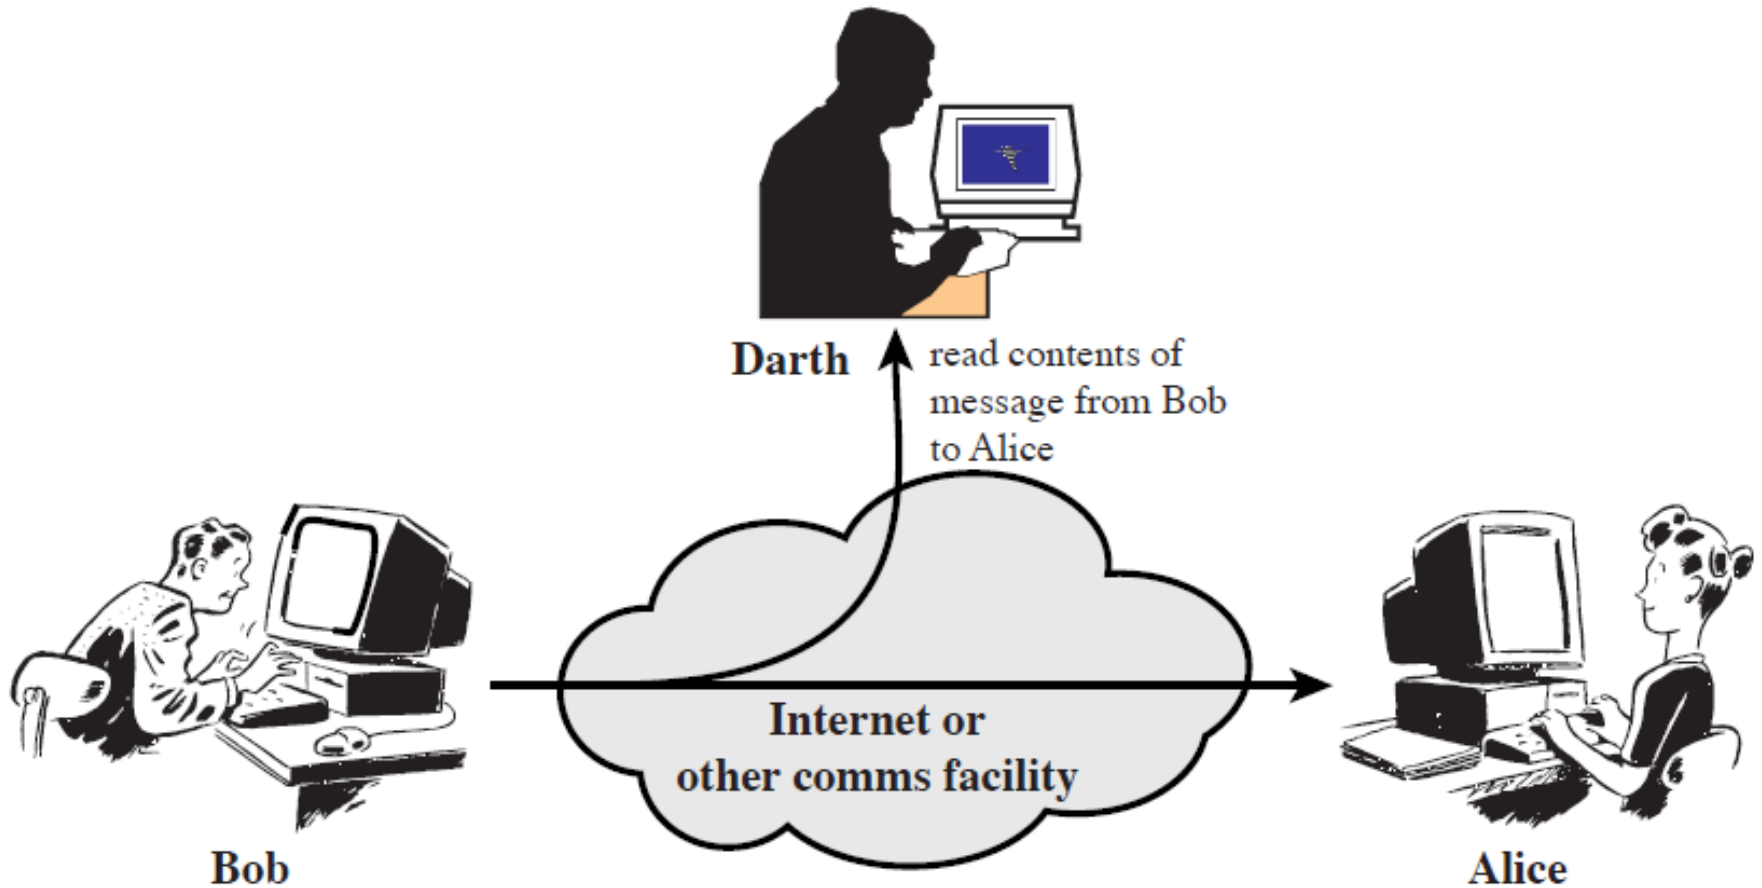

- A threat is an element which can potentially cause harm or loss
- Threats can be human or non-human
- A vulnerability is a weakness that makes it possible for a threat to occur
- An attack is any action by a **threat** exploiting a **vulnerability** in order to cause harm or loss

Active and Passive Threats

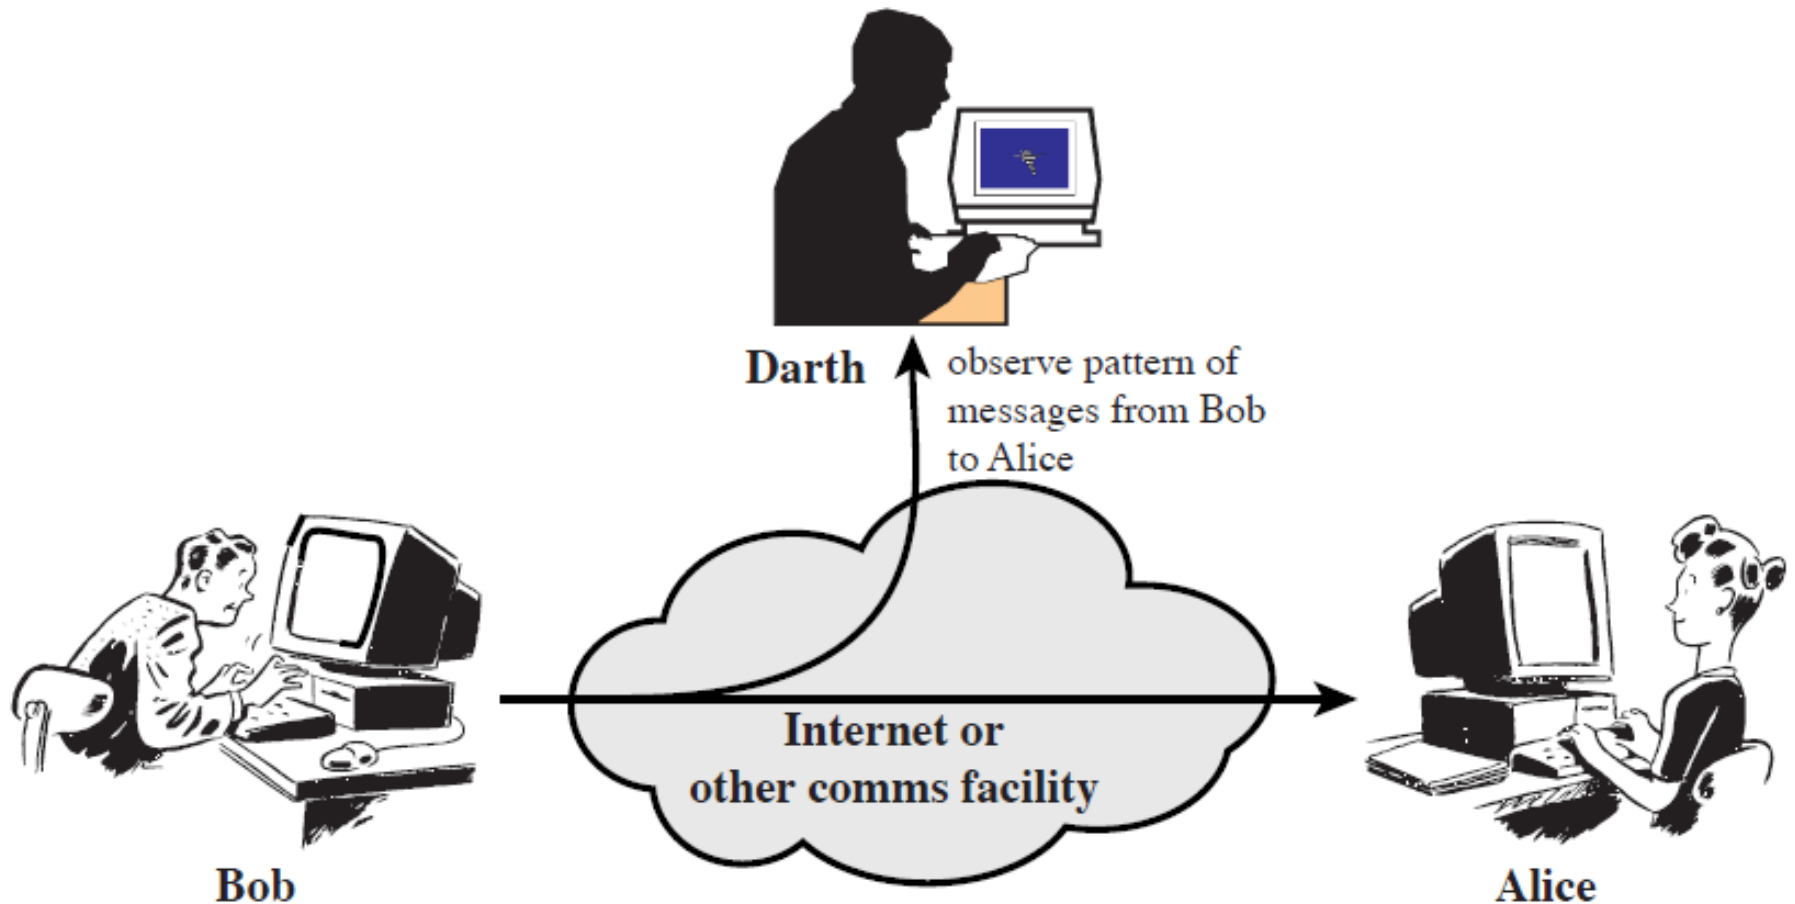

Active and Passive Security Threats

Passive Attack - Eavesdrop

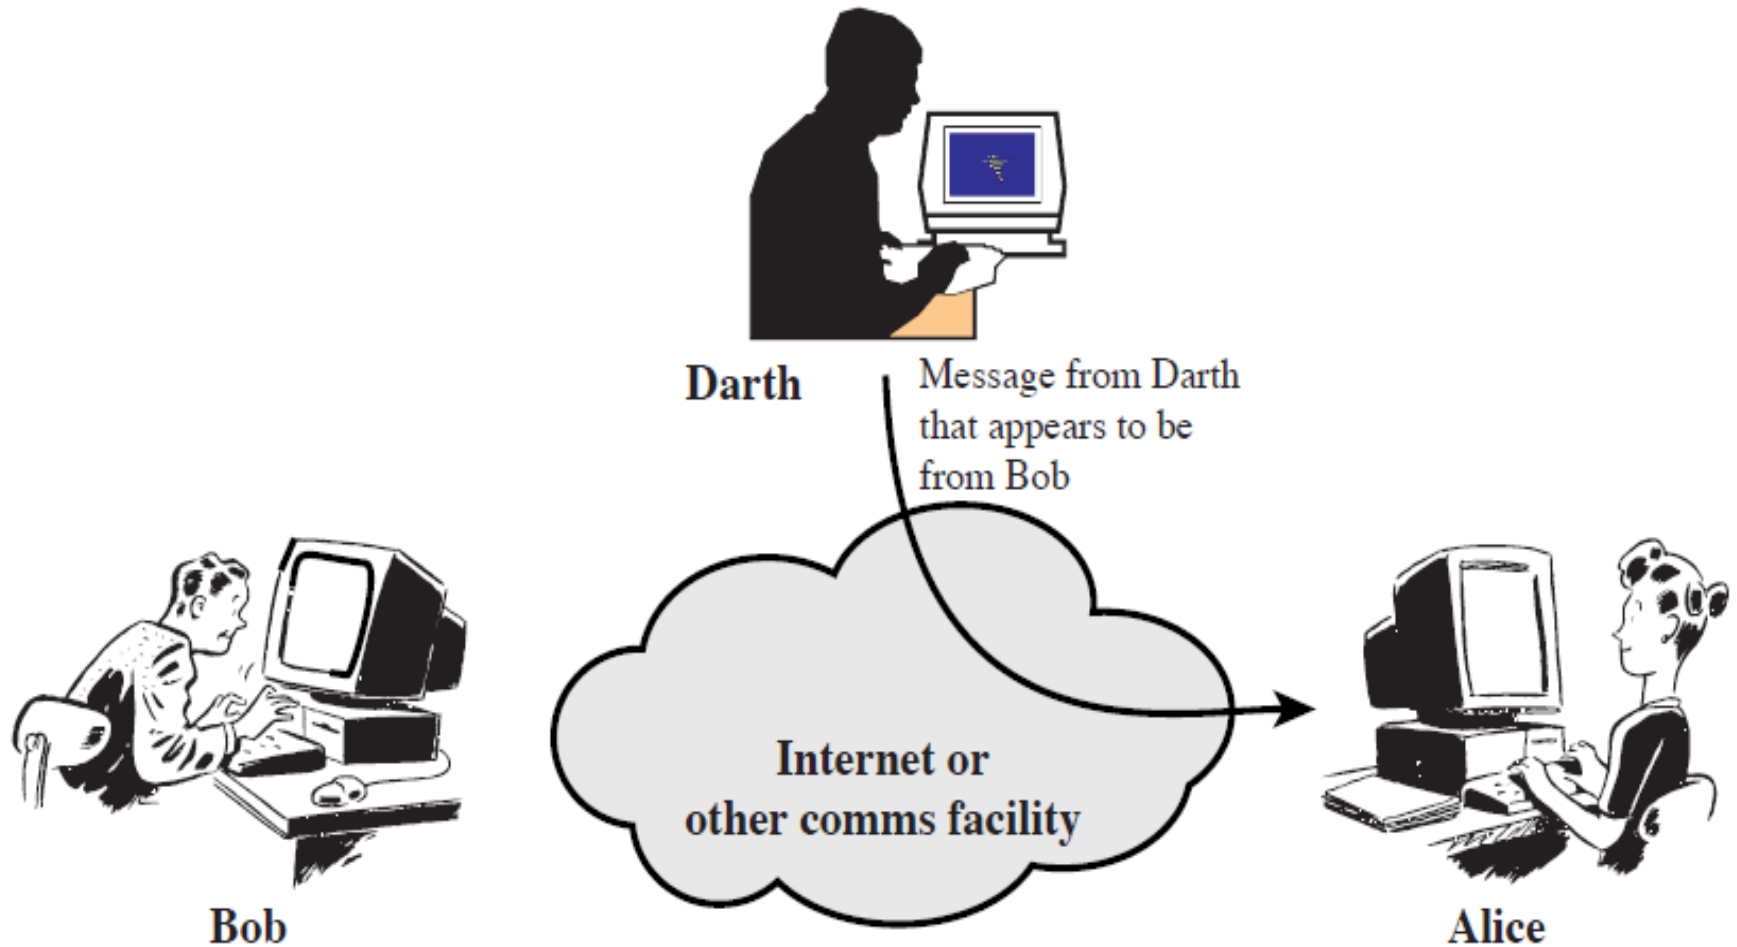

(a) Release of message contents

Passive Attack - Analysis

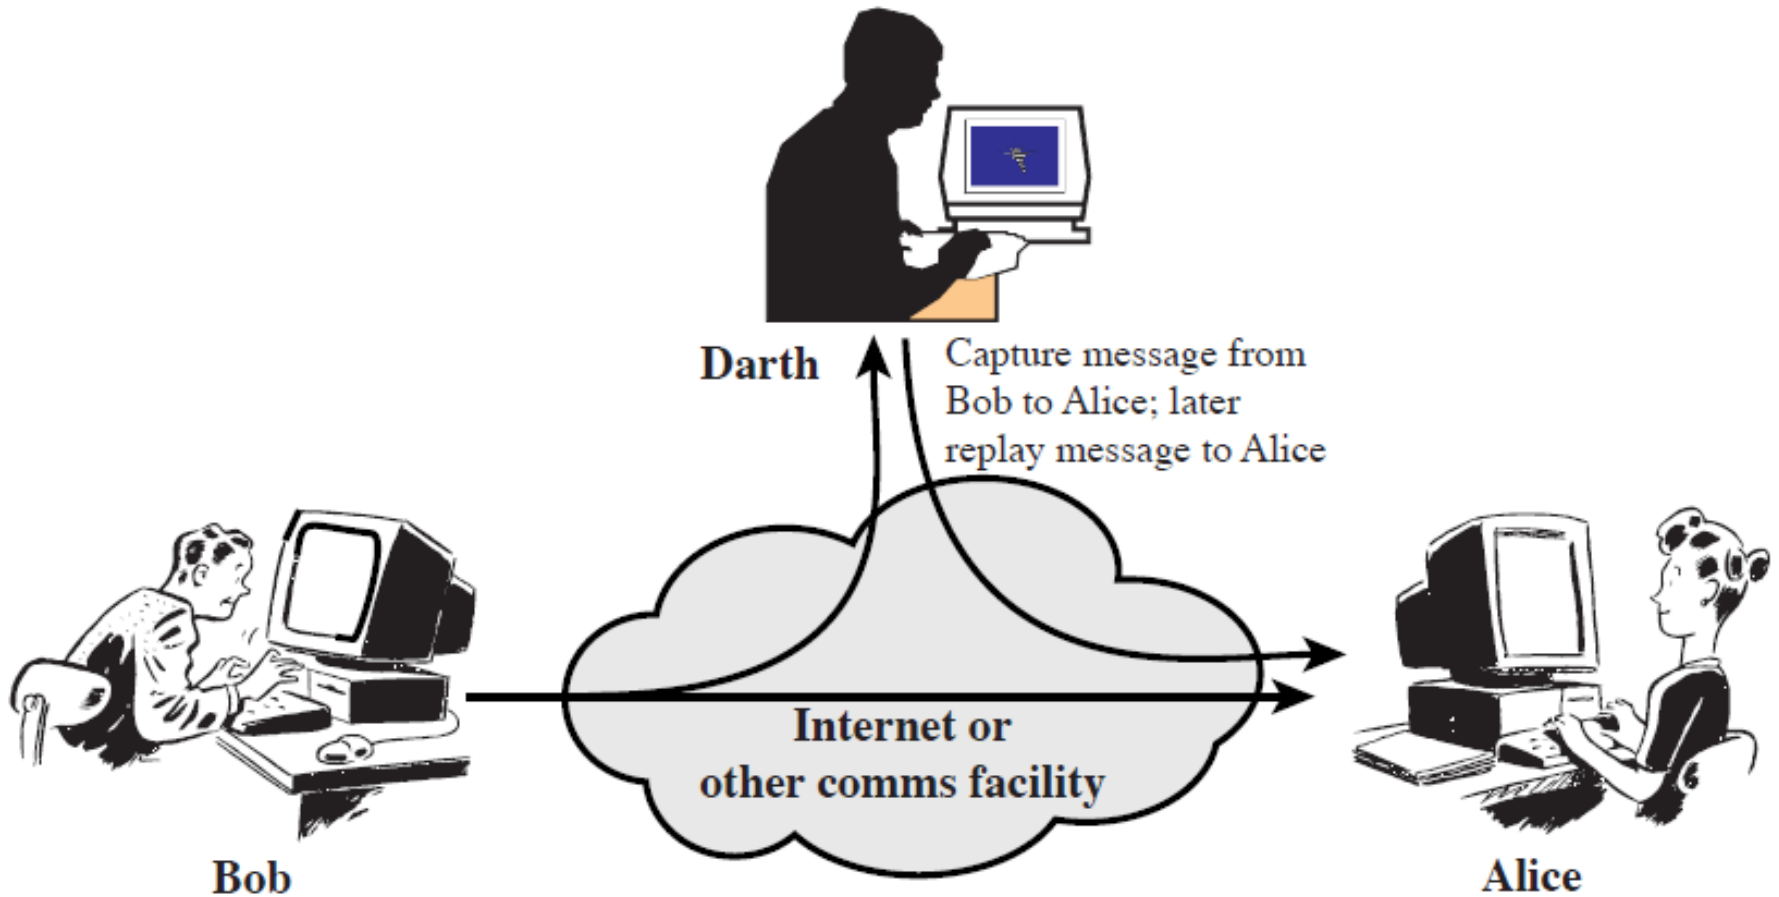

(b) Traffic analysis

Active Attack - Impersonation

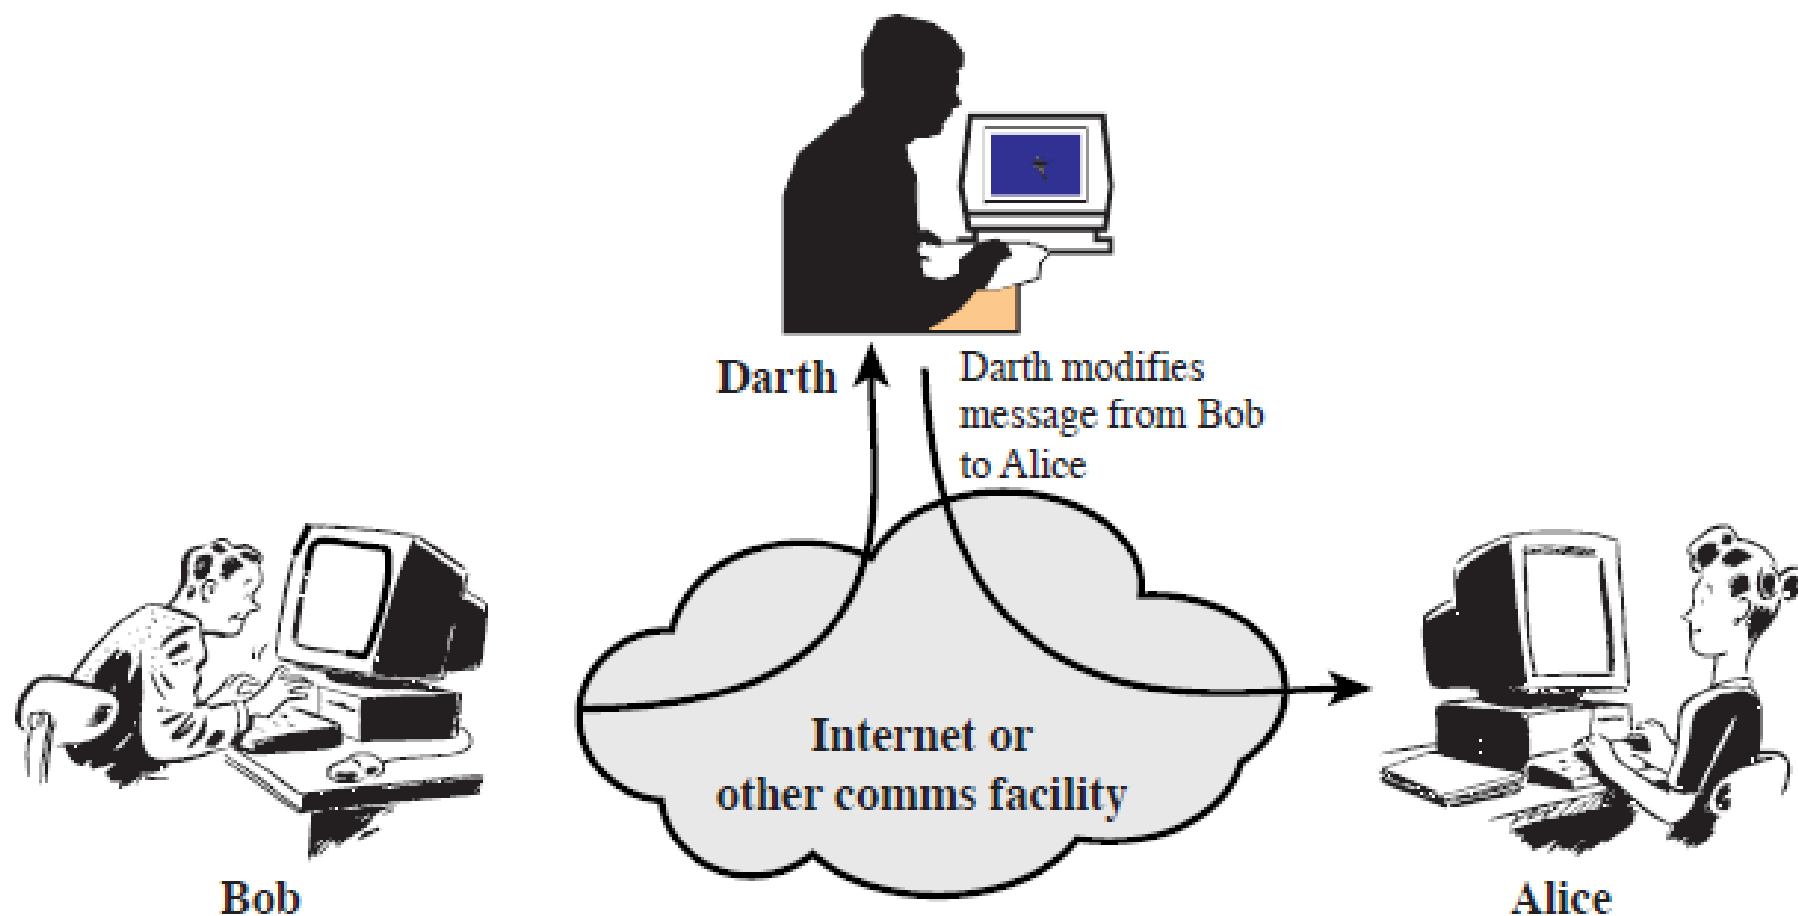

(a) Masquerade

Active - Replay

(b) Replay

Active – Intercept & Modify

(c) Modification of messages

Active - DoS

Attack on Authenticity

- Authenticity is **identification and assurance of origin of information.**

In a network scenario.

Attack on Confidentiality

- Confidentiality is concealment of information.

Value of information.

Attack on Integrity

- Integrity is prevention of unauthorized changes.

Attack on Availability

- Availability is **ability to use information or resources desired.**

Under attack scenario.

Security Attacks

- **Interruption:** This is an attack on
 - availability
- **Interception:** This is an attack on
 - confidentiality
- **Modification:** This is an attack on
 - integrity
- **Fabrication:** This is an attack on
 - authenticity

Sniffing

- It is the easiest attack to launch since all the packets transit through the attacker.
- All the “plaintext” protocols are compromised (the attacker can sniff user and password of many widely used protocol such as telnet, ftp, http).

Data/Packet Injection

- Possibility to add packets to an already established connection.
- The attacker can modify the sequence numbers and keep the connection synchronized while injecting packets.
- If the MITM attack is a “proxy attack” it is even easier to inject (there are two distinct connections).

Command Injection

- Useful in scenarios where a one-time authentication is used.
- In such scenarios, sniffing the password is useless, but hijacking an already authenticated session is critical.
- Injection of commands to the server.
- Emulation of fake replies to the client.

Malicious Code Injection

- Insertion of malicious code into web pages or mail (javascript, trojans, virus).
- Modification on the fly of binary files during the download phase (virus, backdoor).

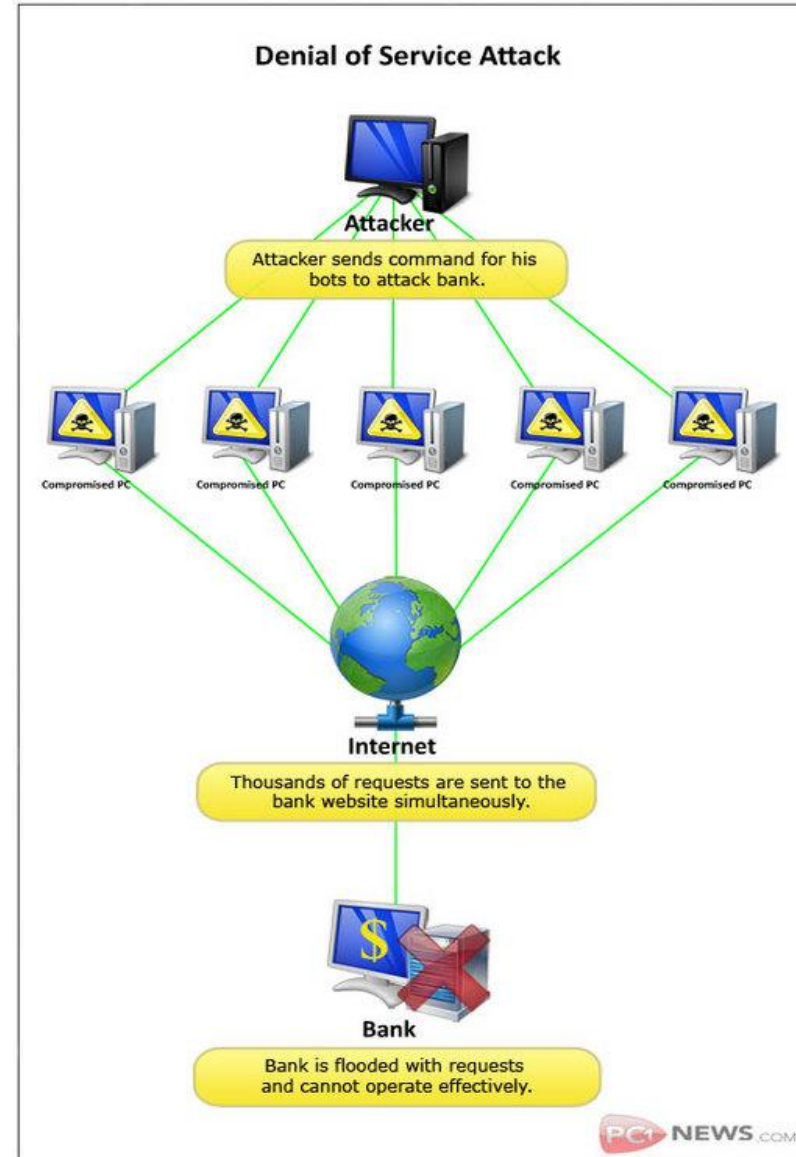

Parameters Substitution

- Parameters exchanged by server and client can be substituted in the beginning of a connection (algorithms to be used later).
- Example: the attacker can force the client to initialize a SSH1 connection instead of SSH2.
 - The server replies in this way:
 - SSH-1.99 -- the server supports ssh1 and ssh2
 - SSH-1.51 -- the server supports ONLY ssh1
 - The attacker makes a filter to replace “1.99” with “1.51”

DDoS Attack

Flooding

- Attacker sends an overwhelming number of messages to your machine; great congestion.
- The congestion may occur in the path before your machine.
- Messages from legitimate users are crowded out.
- Usually called a Denial of Service (DoS) attack, because that's the effect.
- Usually involves a large number of machines, hence Distributed Denial of Service (DDoS) attack.

YOUR COMPUTER HAS BEEN LOCKED

You have broken the law, your actions are illegal and will lead to criminal liability.

The work of your computer has been suspended on the grounds of unauthorized cyberactivity.

Possible violations are described below:

Article – 174. Copyright

Imprisonment for the term of up to 2-5 years
(The use or sharing of copyrighted files). A fine from 18,000 up to 23,000 GBP.

Article - 183. Pornography

Imprisonment for the term of up to 2-3 years
(The use or distribution of pornographic files). A fine from 18,000 up to 25,000 GBP.

Article – 184. Pornography involving children (under 18 years)

Imprisonment for the term of up to 10-15 years
(The use or distribution of pornographic files). A fine from 20,000 up to 40,000 GBP.

Article – 104. Promoting Terrorism

Imprisonment for the term of up to 25 years without appeal
(Visiting the websites of terrorist groups). A fine from 35,000 up to 45,000 GBP with property confiscation.

Article – 68. The distribution of virus programs

Imprisonment for the term of up to 2 years
(The development or distribution of virus programs, which have caused harm to other computers). A fine from 15,000 up to 28,000 GBP.

Article – 113. The use of unlicensed software

Imprisonment for the term of up to 2 years
(The use of unlicensed software). A fine from 10,000 up to 22,000 GBP.

Article - 99. Cheating with payment cards, carding

Imprisonment for the term of up to 5 years
(The operation with the use of payment card or its details which was not initiated or not confirmed by the holder). A fine from 30,000 up to 75,000 GBP with property confiscation.

Article – 156. Spamming pornographic content

Imprisonment for the term of up to 2 years
(Spamming pornographic content by means of e-mail or social Networks). A fine from 16,000 up to 38,000 GBP.

ALL ILLEGAL ACTIVITIES CONDUCTED THROUGH YOUR COMPUTER HAVE BEEN RECORDED IN THE POLICE DATABASE, INCLUDING PHOTOS AND VIDEOS FROM YOUR CAMERA FOR FURTHER IDENTIFICATION. YOU HAVE BEEN REGISTERED BY VIEWING PORNOGRAPHY INVOLVING MINORS.

Video-recording: ON

AN ATTEMPT TO UNLOCK THE COMPUTER BY YOURSELF WILL LEAD TO THE FULL FORMATTING OF ALL YOUR DATA EXCEPT THE FILES WHICH MAY BE CONSIDERED AS EVIDENCES OF CRIMINALITY.

A first-time violation may not lead to imprisonment. In the case of a first-time violation you just need to pay the fine according the Law Of Loyalty To The People as of December, 04, 2012.

To unlock your computer and to avoid other legal consequences, you are obligated to pay a release fee of **100 GBP**.

You can get Ukash from hundreds of thousands of global locations, online, from wallets, from kiosks and ATMs.

Exchange your cash for a Ukash voucher and use your voucher code in form below.

Code:

SUBMIT

Status: Waiting for Payment

Where can I buy Ukash

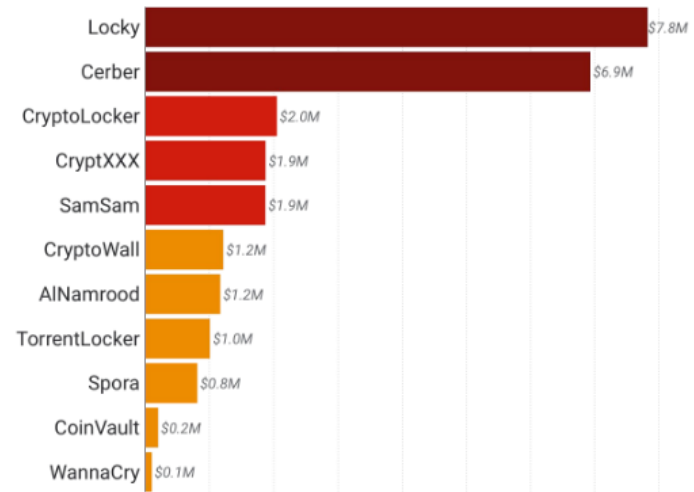

Please note: This fine may only be paid within 48 hours, if you let 48 hours pass without payment, the possibility of unlocking your computer expires. In this case a criminal case against you will be initiated automatically.

Ransomware

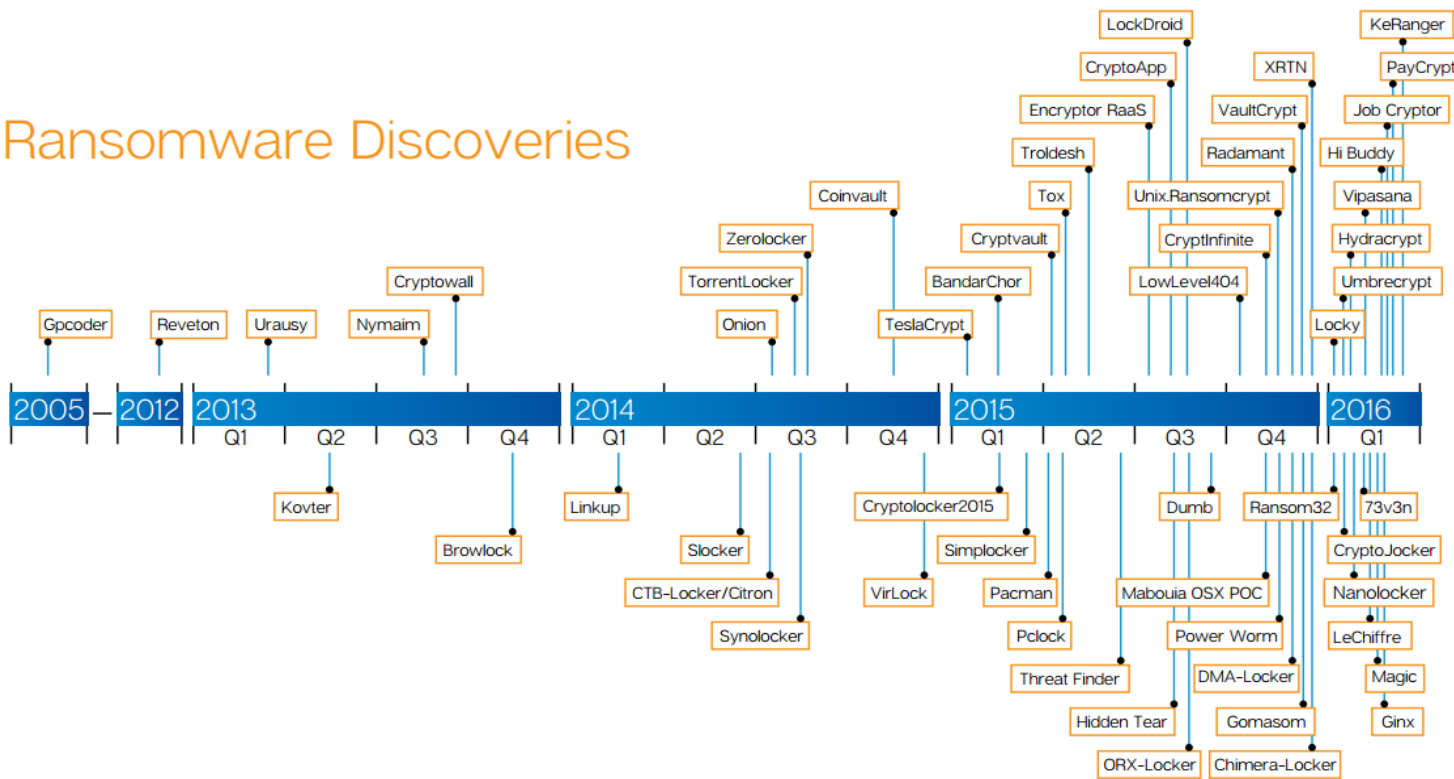

- **Ukash Ransomware** - pretends alert from PCeU.
- Asking you to pay a fine of 100£ in the form of a Ukash or PaySafecard code.
- Also has the ability to access your installed webcam.
- Ignore any such alert and remove this Trojan ransomware.
- Under no circumstance should you send any money to PCeU cyber criminals as this could lead to identity theft.
- Remove Trojan:
 - System restore
 - Malwarebytes anti-malware
 - HitmanPro (cloud anti-malware)
 - Kaspersky rescue disk

Ransomware Discoveries

0-day (Zero Day) Vulnerabilities

It is an unknown exploit that exposes a vulnerability in software or hardware and can create complicated problems well before anyone realizes something is wrong.

In fact, a zero-day exploit leaves NO opportunity for detection ... at first.

The term 'zero-day' refers to an unknown vulnerability that the developer is newly aware of, and thus an official patch or update to fix the issue has not been released.

IE zero-day vulnerability exploited more widely than previously thought

Lucian Constantin | Sept. 30, 2013

A recently announced and yet-to-be-patched vulnerability that affects all versions of Microsoft Internet Explorer (IE) has been exploited in targeted attacks against organizations in Taiwan since the beginning of July, according to security researchers.

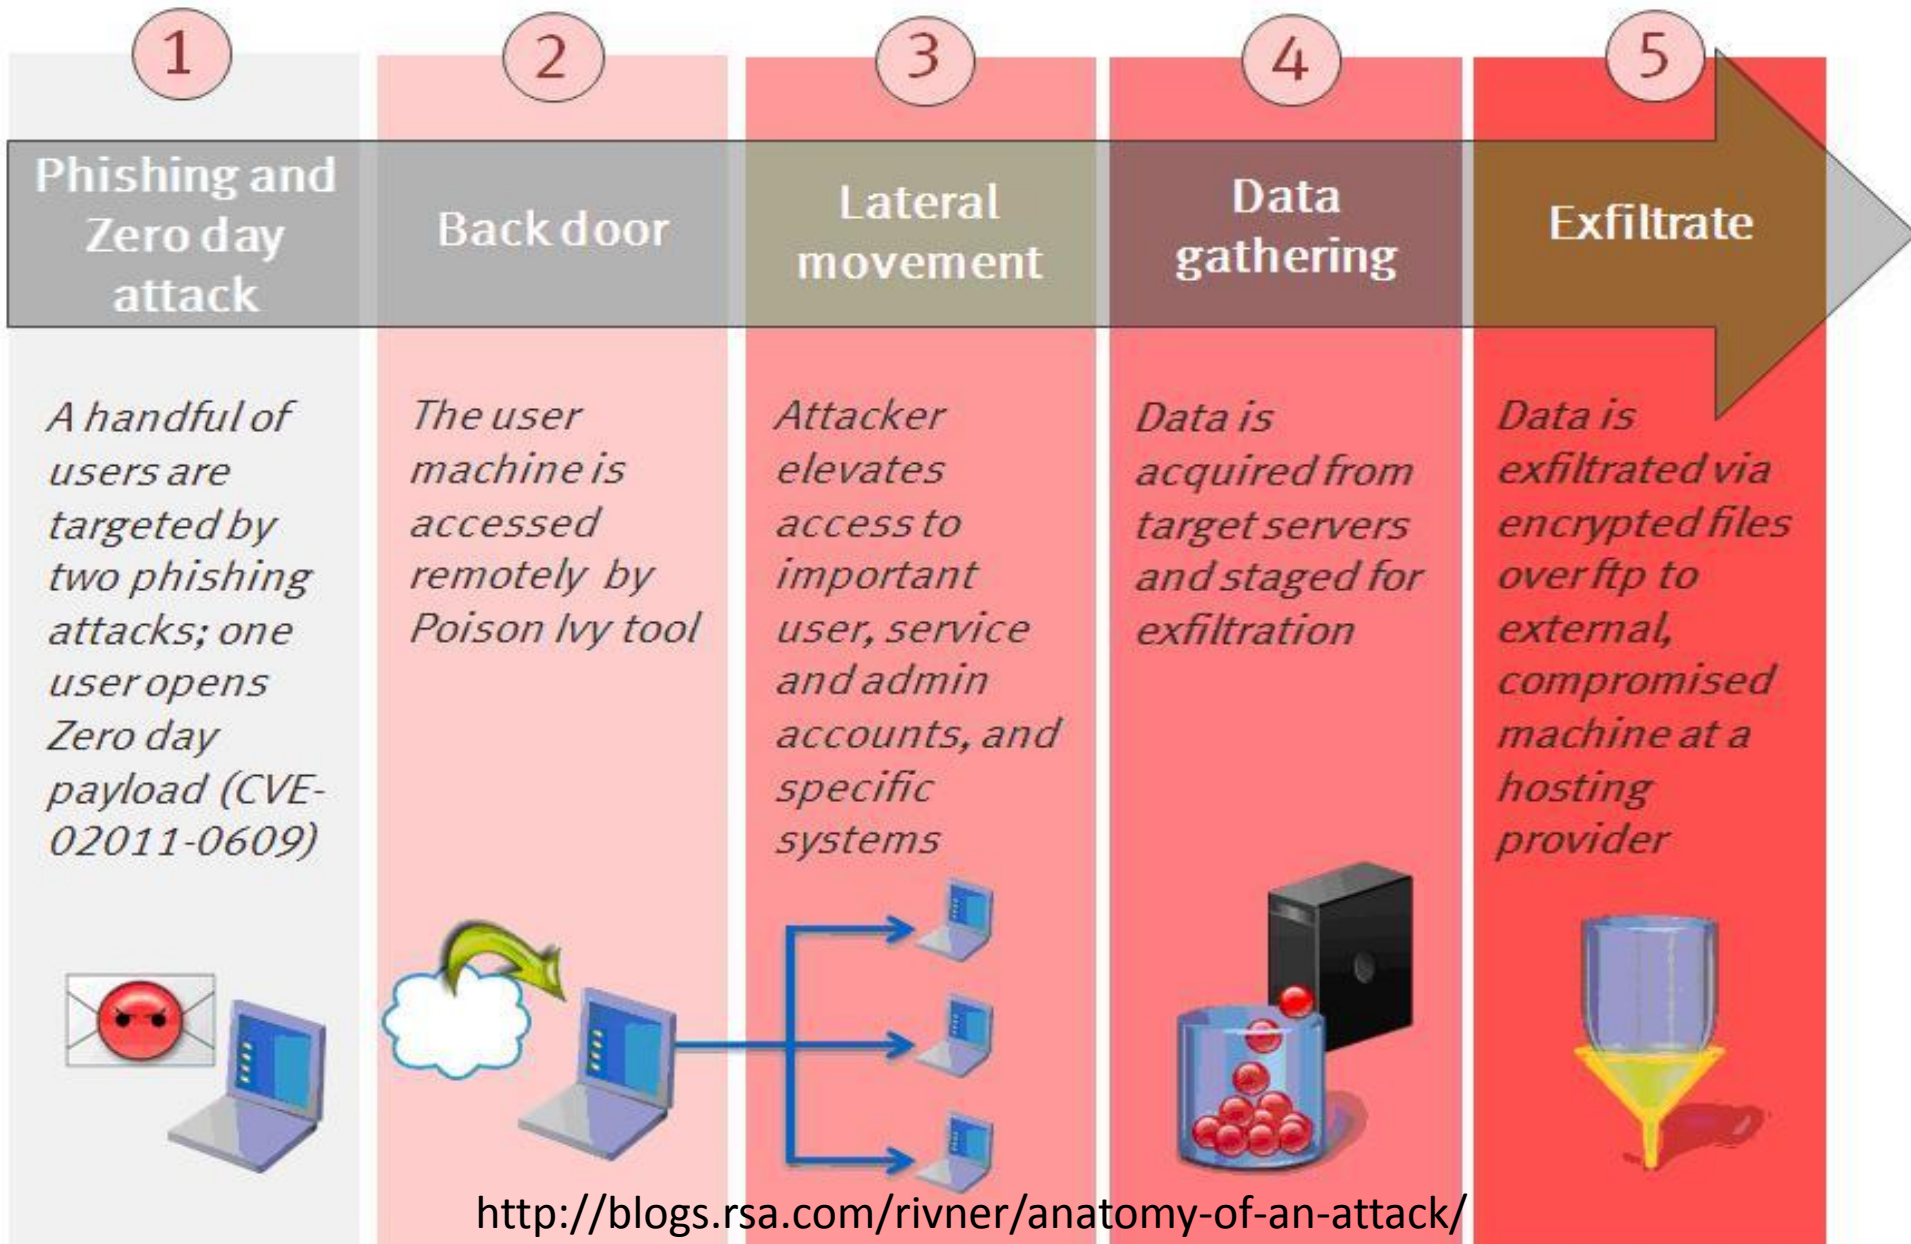

Microsoft published a [security advisory](#) about the vulnerability, which is identified as CVE-2013-3893, on Sept. 17 and warned users that it is "aware of targeted attacks that attempt to exploit this vulnerability in Internet Explorer 8 and Internet Explorer 9.

The company released a Microsoft "Fix it" [workaround](#) that customers can manually download and install in order to mitigate the vulnerability. However, no patch has yet been released through Windows Update.

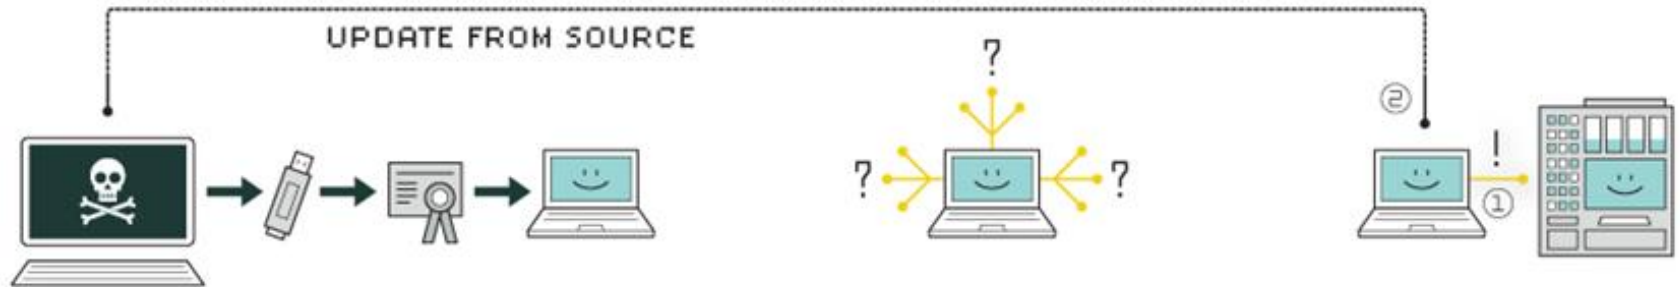

On Saturday, researchers from security firm FireEye reported that a known hacker group has been using the vulnerability to [target organizations in Japan](#) as part of an attack campaign dubbed "Operation DeputyDog" that started on Aug. 19. They believe that this is the same group that managed to break into the computer network of security firm Bit9 as part of a different attack campaign in February and used one of its systems to digitally sign several pieces of malware.

Advanced Persistent Threat (APT)

Stuxnet

1. infection

Stuxnet enters a system via a USB stick and proceeds to infect all machines running Microsoft Windows. By brandishing a digital certificate that seems to show that it comes from a reliable company, the worm is able to evade automated-detection systems.

2. search

Stuxnet then checks whether a given machine is part of the targeted industrial control system made by Siemens. Such systems are deployed in Iran to run high-speed centrifuges that help to enrich nuclear fuel.

3. update

If the system isn't a target, Stuxnet does nothing; if it is, the worm attempts to access the Internet and download a more recent version of itself.

4. compromise

The worm then compromises the target system's logic controllers, exploiting "zero day" vulnerabilities—software weaknesses that haven't been identified by security experts.

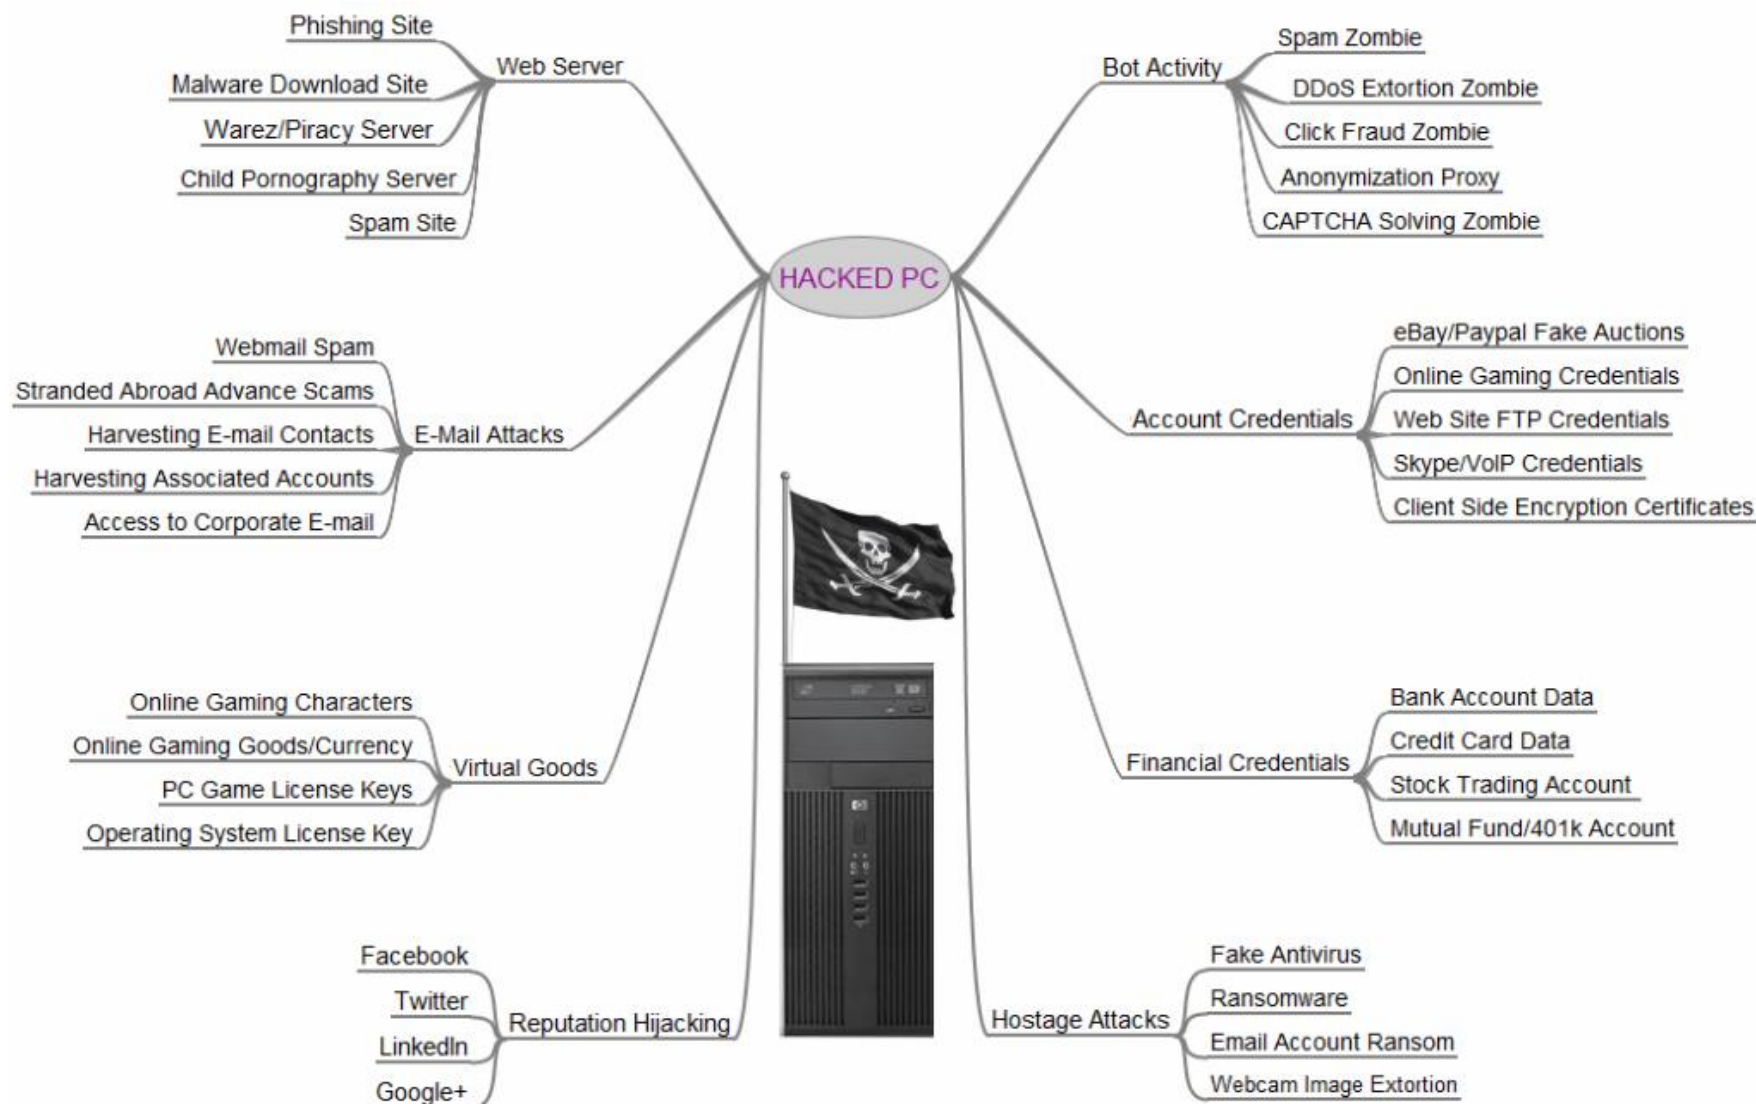

5. control

In the beginning, Stuxnet spies on the operations of the targeted system. Then it uses the information it has gathered to take control of the centrifuges, making them spin themselves to failure.

6. deceive and destroy

Meanwhile, it provides false feedback to outside controllers, ensuring that they won't know what's going wrong until it's too late to do anything about it.

Why Should I Care?

Human Factors/Usable Security

- *User: “How can I secure my computer against all cyber attacks?”*
- *Security person: “Easy. Disconnect it from the internet, turn it off and put it back in the box. And who said you could unpack it?”*
- Usable security also covers the design, development, configuration and maintenance of the tools and systems the business runs on.

Cont.

- Poor usability often = poor security
- *It's worth bearing in mind that usability doesn't depend on security (you can easily make a product very simple to use, and also very insecure), but security often does depend on usability.*
- If a product has to be used in a particular way in order to be secure - but people cannot easily use it that way - the product is not secure in any meaningful sense.

Human Factors/Usable Security

- **Usability**
 - assesses how easy user interfaces are to use.
 - also refers to methods for improving ease-of-use during design process.
- Usability is defined by **5 quality components**:
- **Learnability**:
 - How easy is it for users to accomplish basic tasks the first time they encounter the design?
- **Efficiency**:
 - Once users have learned the design, how quickly can they perform tasks?
- **Memorability**:
 - When users return to the design after a period of not using it, how easily can they re-establish proficiency?
- **Errors**:
 - How many errors do users make, how severe are these errors, and how easily can they recover from the errors?
- **Satisfaction**:
 - How pleasant is it to use the design?

Cont.

- Utility = whether it provides the **features you need**.
- Usability = how **easy & pleasant** these features are to use.
- **Useful = usability + utility.**
- e.g., software based on password policy, authentication policy, web login page, mobile phone login access, etc.
