

CMT308: Business Continuity & Transformation

Omer Rana
ranaof@cardiff.ac.uk

Threats (from Amir Javed: CMT116)

- **Employee are more like to be hit by Email Threat**
 - Phishing (1 in 3,207)
 - Spamming (55% of email analysed by Symantec in 2018 as spam)
 - Email – can be of two type, as attachment or as link. Microsoft Office users are the most at risk of falling victim to email-based malware, with Office files accounting for 48 percent of malicious email attachments.
- **Malware Threat**
 - Self propagating financial trojans (Emotet and Qakbot)
 - Execution of Powershell Script such as VBS.Downloader and JS.Downloader
- **Cryptojacking – Ransomware.**

Threats (from Amir Javed: CMT116)

- **Web attacks**

- 1 in 10 URL pointing to malicious web server
- 1.3 million unique web attacks reported by Symantec in 2018
- Exploit Kits to carry out web attacks
- On average 4,800 website compromised by Formjacking.

Threats (from Amir Javed: CMT116)

- **Mobile malware**

- Ransomware for mobile. (63% of companies in US got affected by ransomware malware)
- 1 in 36 devices in organisation were considered as high risk. Why ?
- Devices that were rooted or jailbroken, along with devices that had a high degree of certainty that malware had been installed.

Threats (from Amir Javed: CMT116)

- IoT

- On average 5,200 IoT based attacks reported by Symantec in 2018.
- Routers and connected cameras were by far the main source of IoT attacks.
- Attackers were also increasingly focused on Telnet as an avenue for attack and accounted for over 90 percent of attempted attacks.

Business Processes

- **Process Documentation**

- Understanding and formalizing the process

- **Process Design and Analysis**

- Analysis of process properties (i.e. time taken to complete the process)
- This step is useful when understand the critical path
- Understand impact on Business Continuity

- **Process Automation / Workflow**

- Enacting/executing the process in an automated manner

- **Process Re-engineering / Optimisation**

- Re-engineering using new services (e.g. use of Service Oriented Architectures, Cloud Computing)

What is a Business Process?

- Generally no agreement on what constitutes a Business Process – but a lot of common themes around definitions and tools

A sequence of activities performed by one or more participants in order to deliver value to the business

A process: consists of a sequence of simpler activities

Activities performed by a human participant or an automated system

Activities are coordinated through intermediate validation gateways or events

Examples:

Ordering a pizza

Approval of a finance form

Checking patient consent

Processes can be:

- Management Process
 - General management of a business or organization
 - May have a strategic focus
- Operational Process
 - Set of activities that create the “primary value stream”
- Supporting Process
 - Supports the core operation processes

Understand
(measure, cost)

Improve
(Streamline,
rationalize)

Design new
(Additional
capability)

Automate

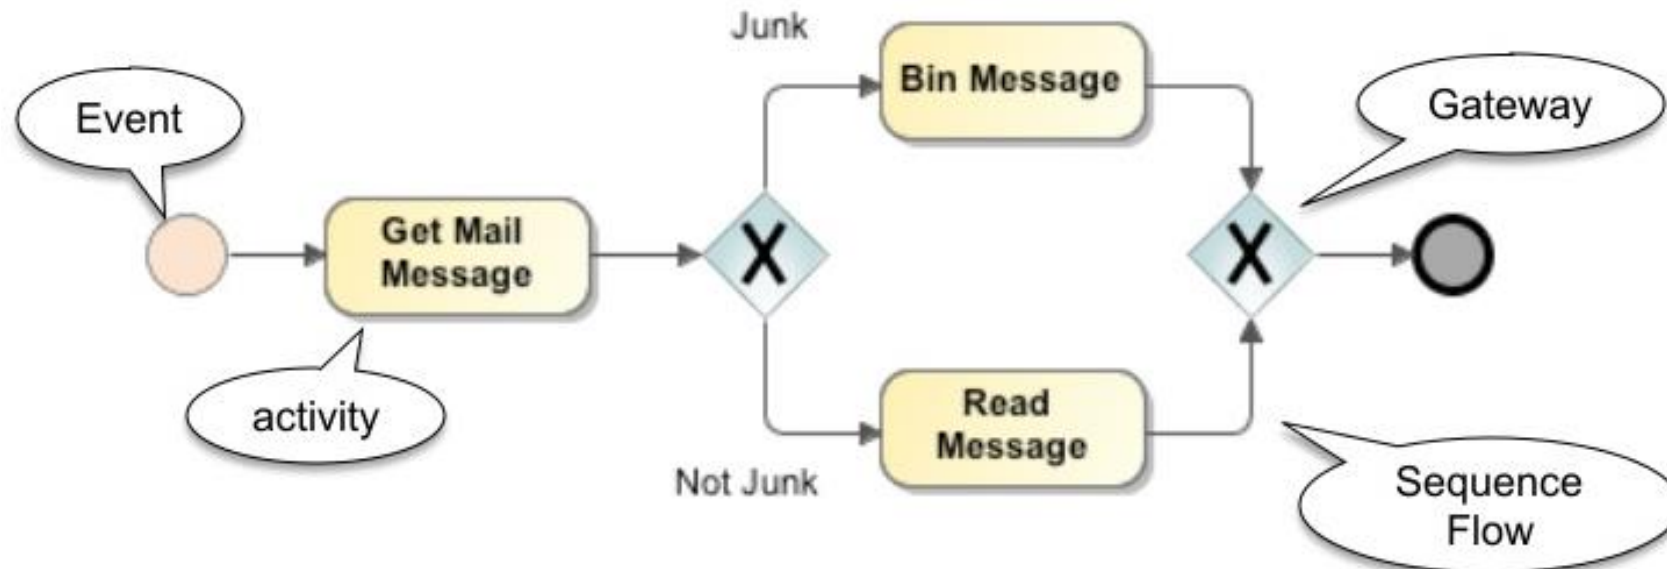

BPMN notation ... summary (Dr Jim Arlow)

BPMN ISO Standard –
ISO 19510:2013

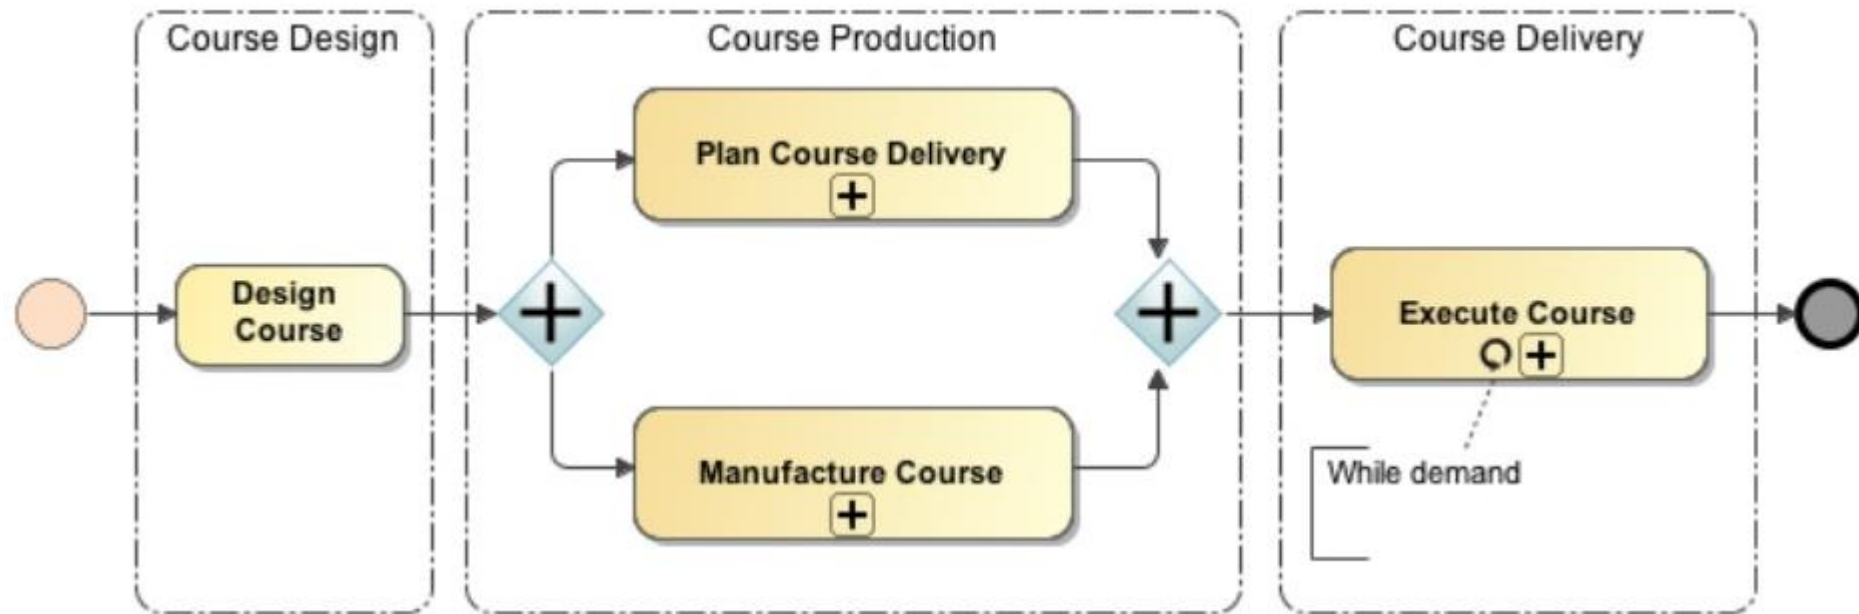

BPMN: Process diagram

- BPMN – defines a process as a set of flow elements the comprise different types of flow nodes – connected into a sequence
- Flow nodes:
 - Events: something that happened during the process
 - Activities: work performed in the process
 - Gateways: control flow through the process

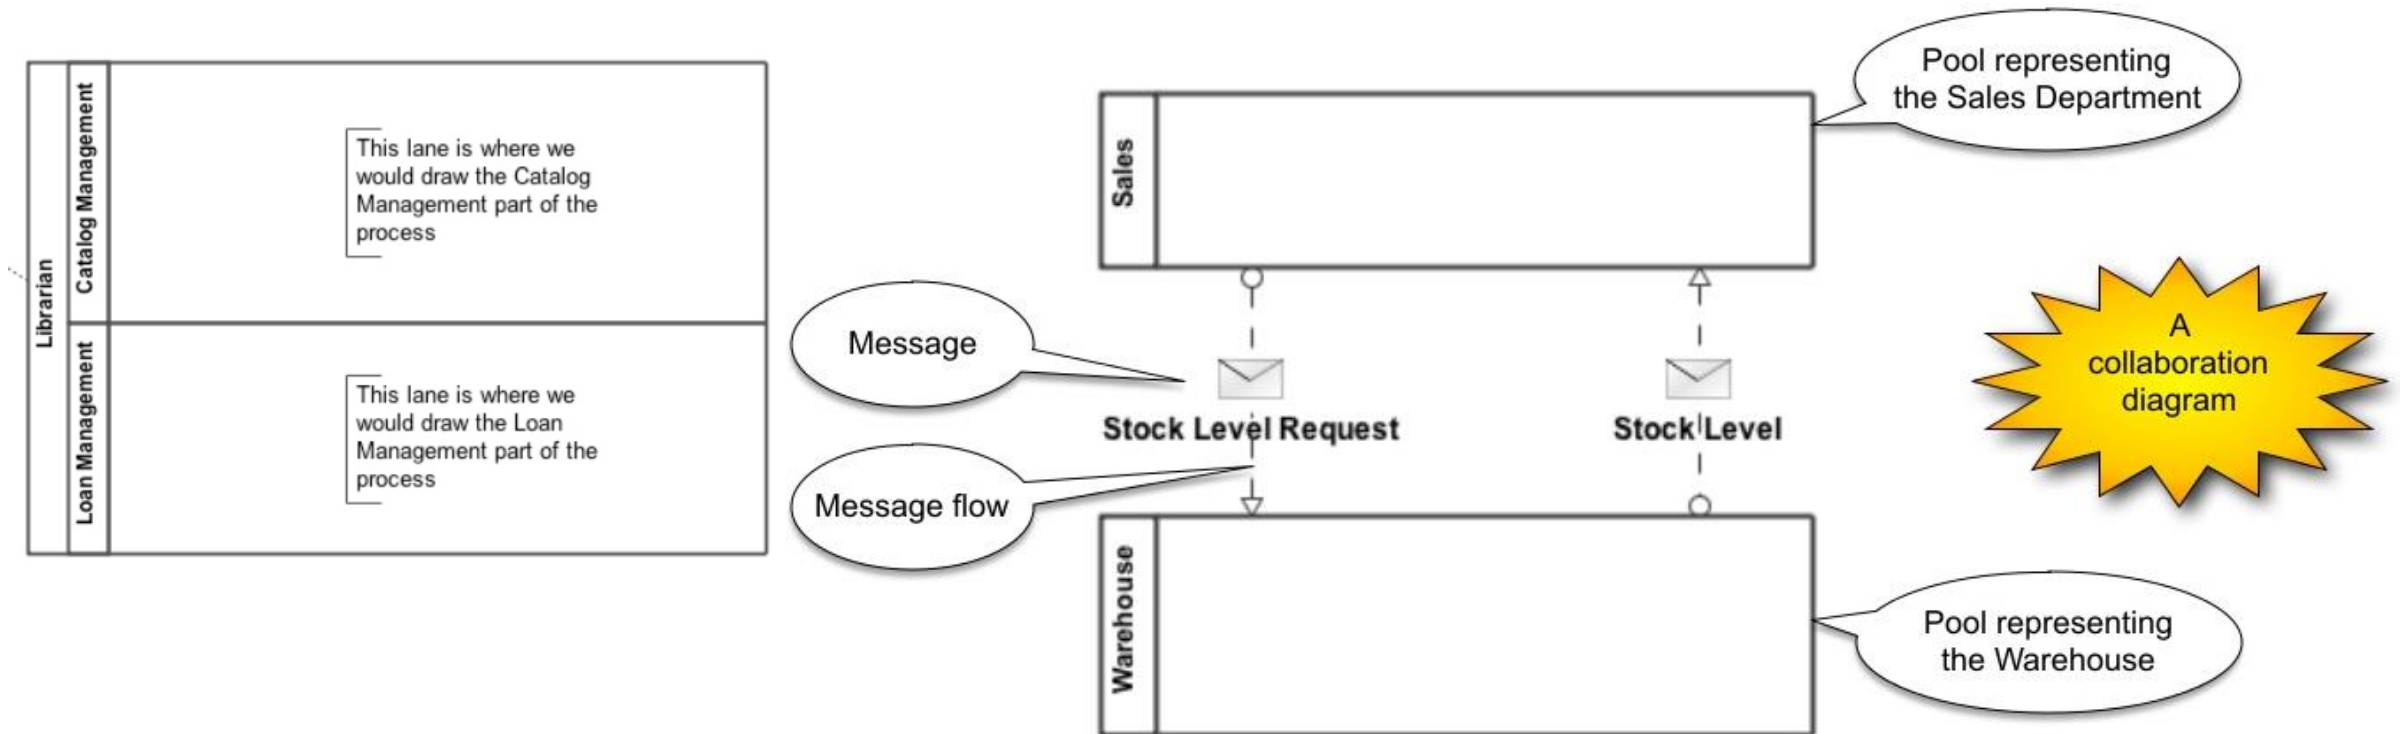

Groups

- Use of groups to organize and highlight parts of the model in order to improve comprehensibility + also manage hierarchy
- Groups can contain a collection of processes

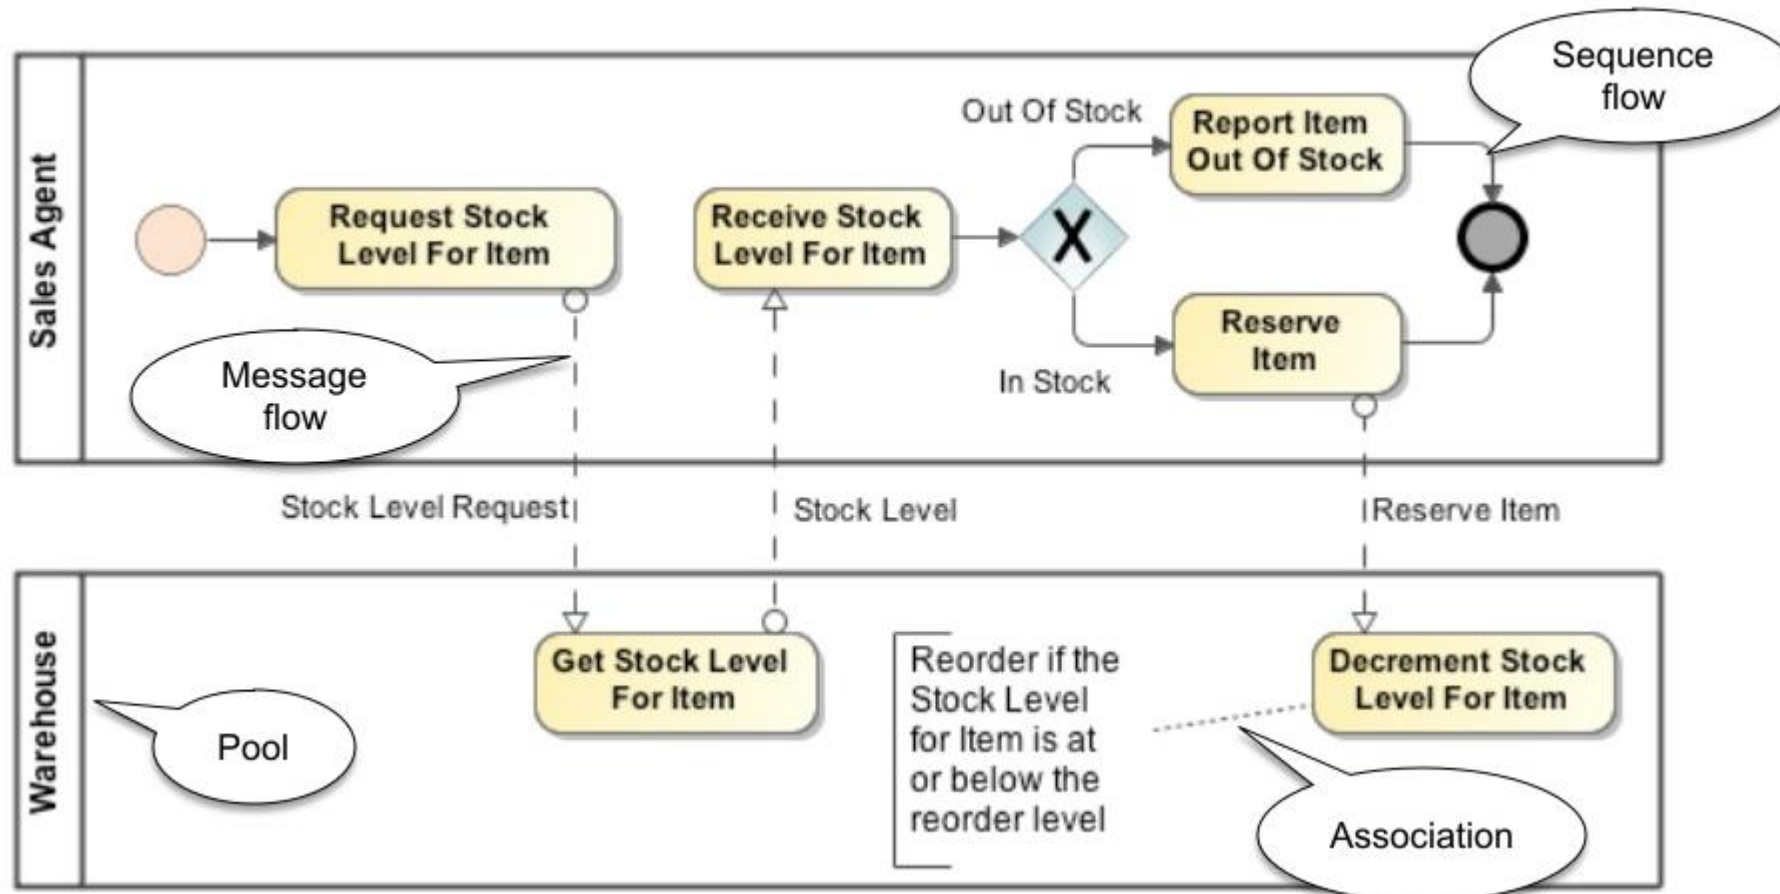

Collaboration Diagram: Pools, message flows & messages

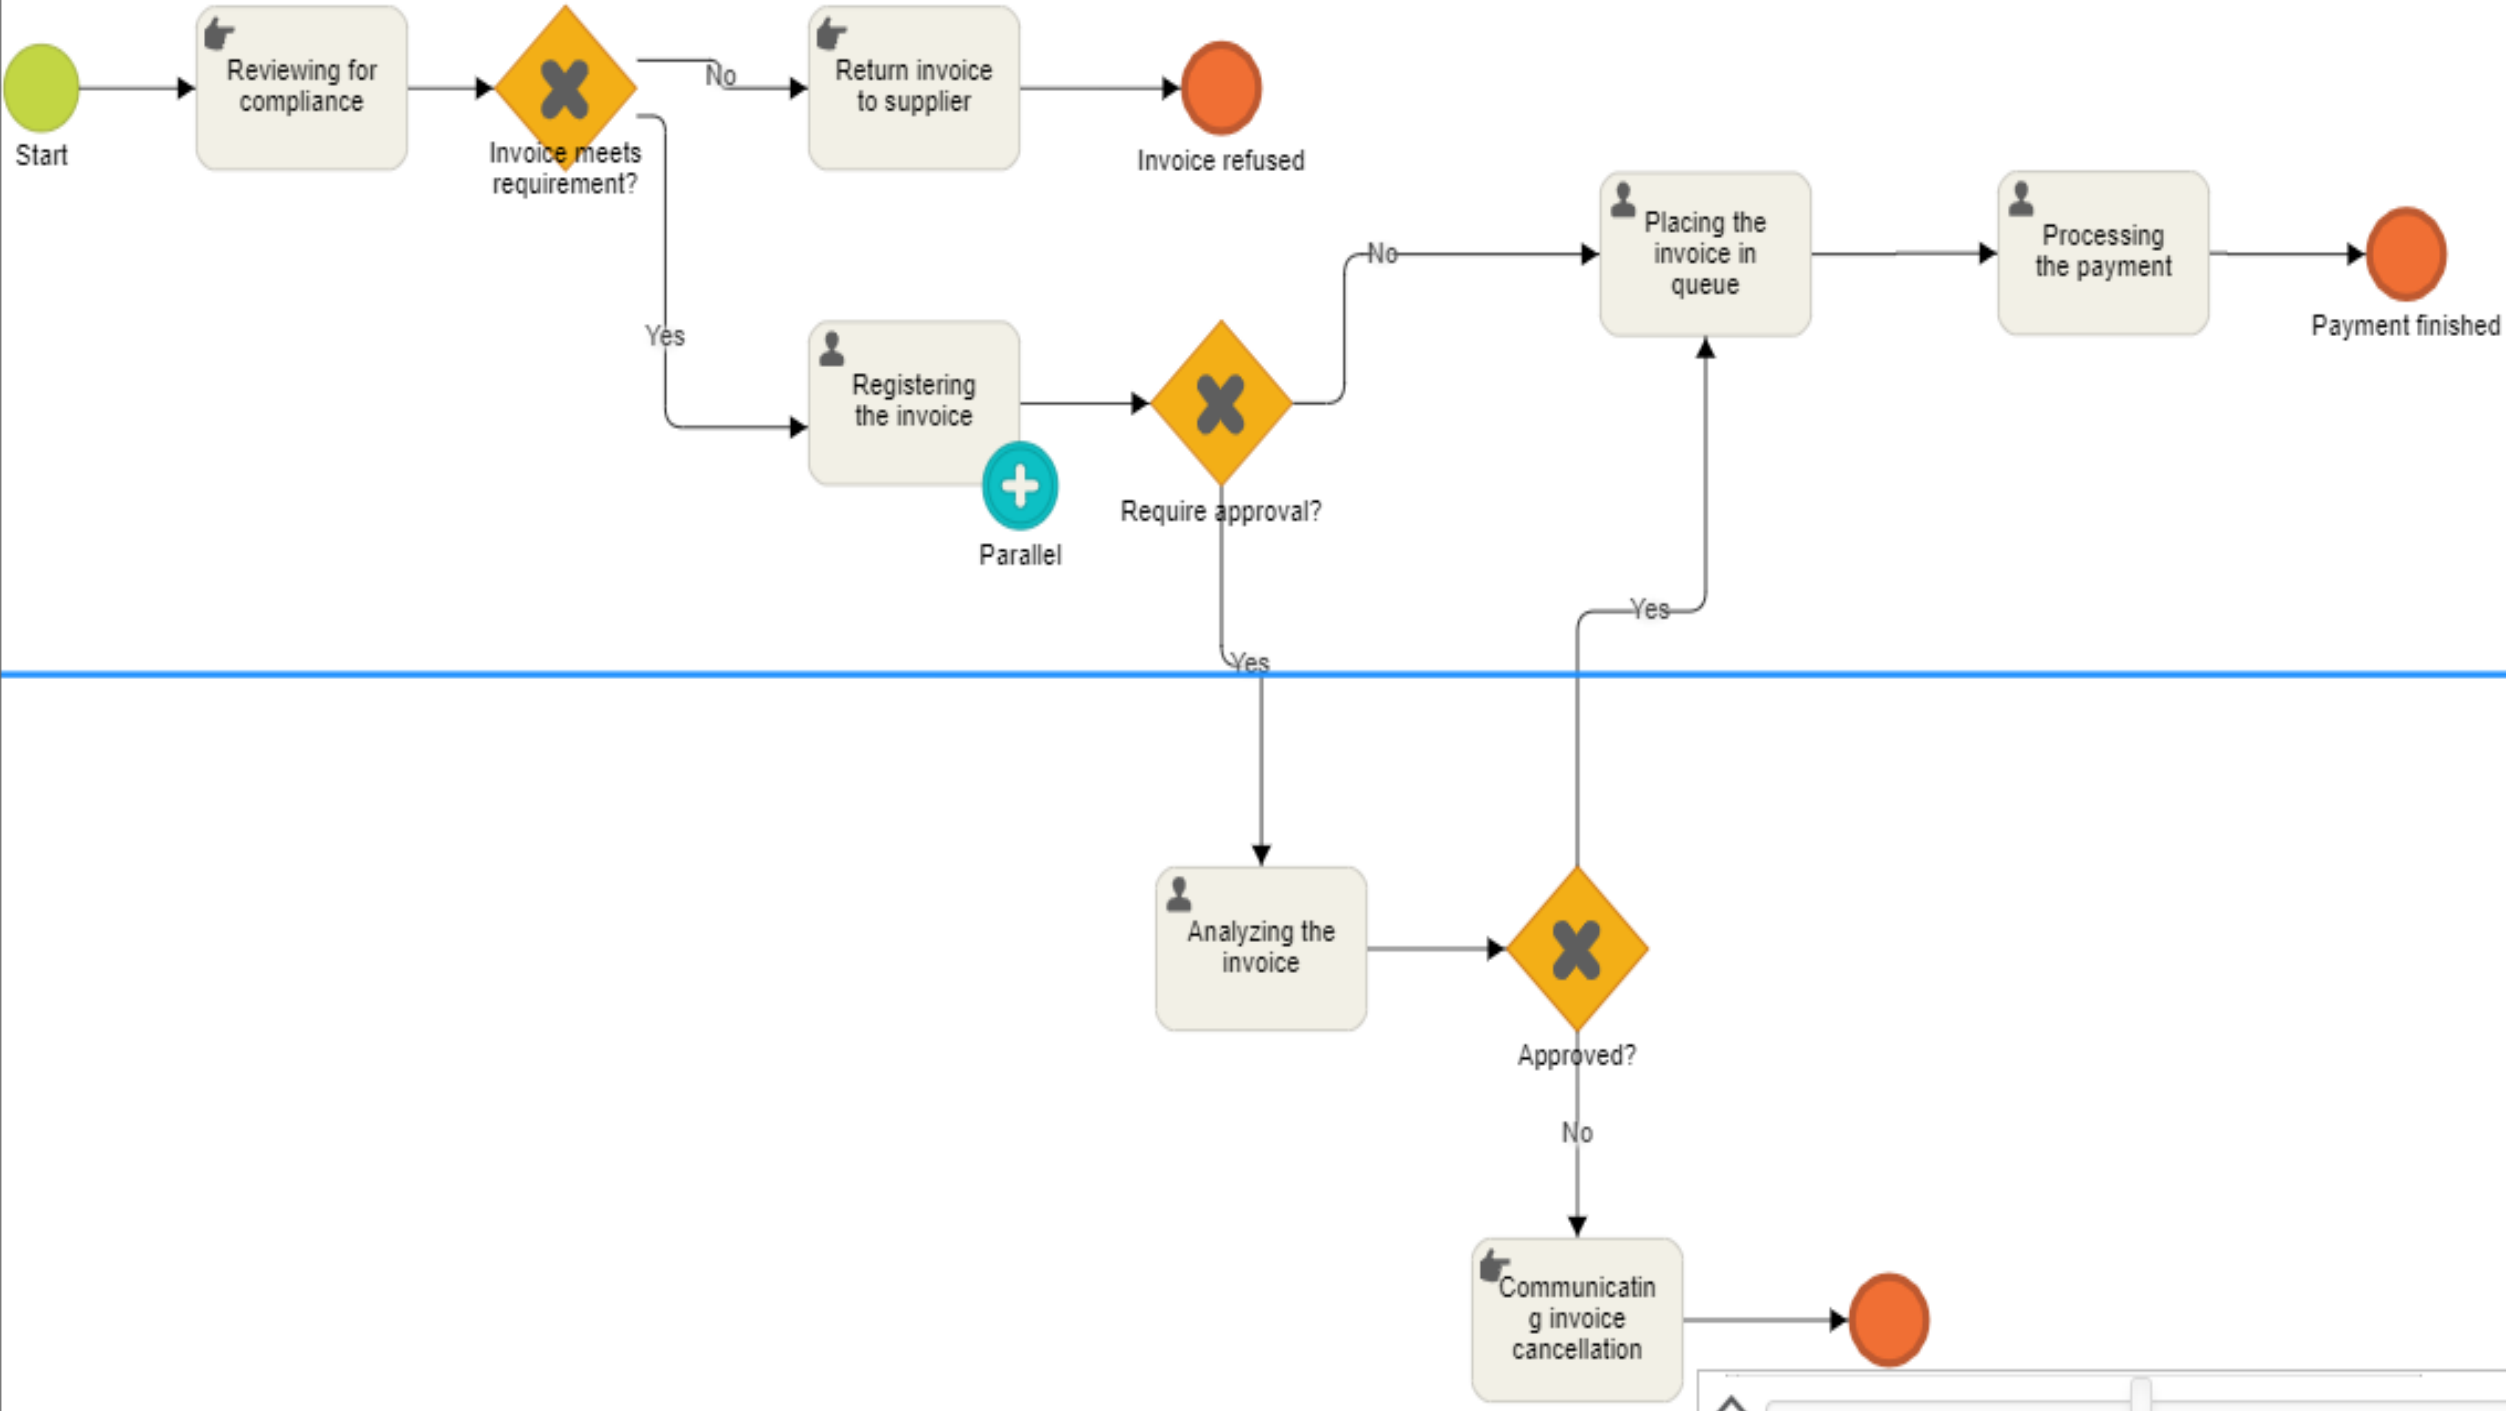

- Interaction between multiple participants
- Pools: participant in a process; Lanes: grouping related activities
- Explicit messages – showing communication between participants

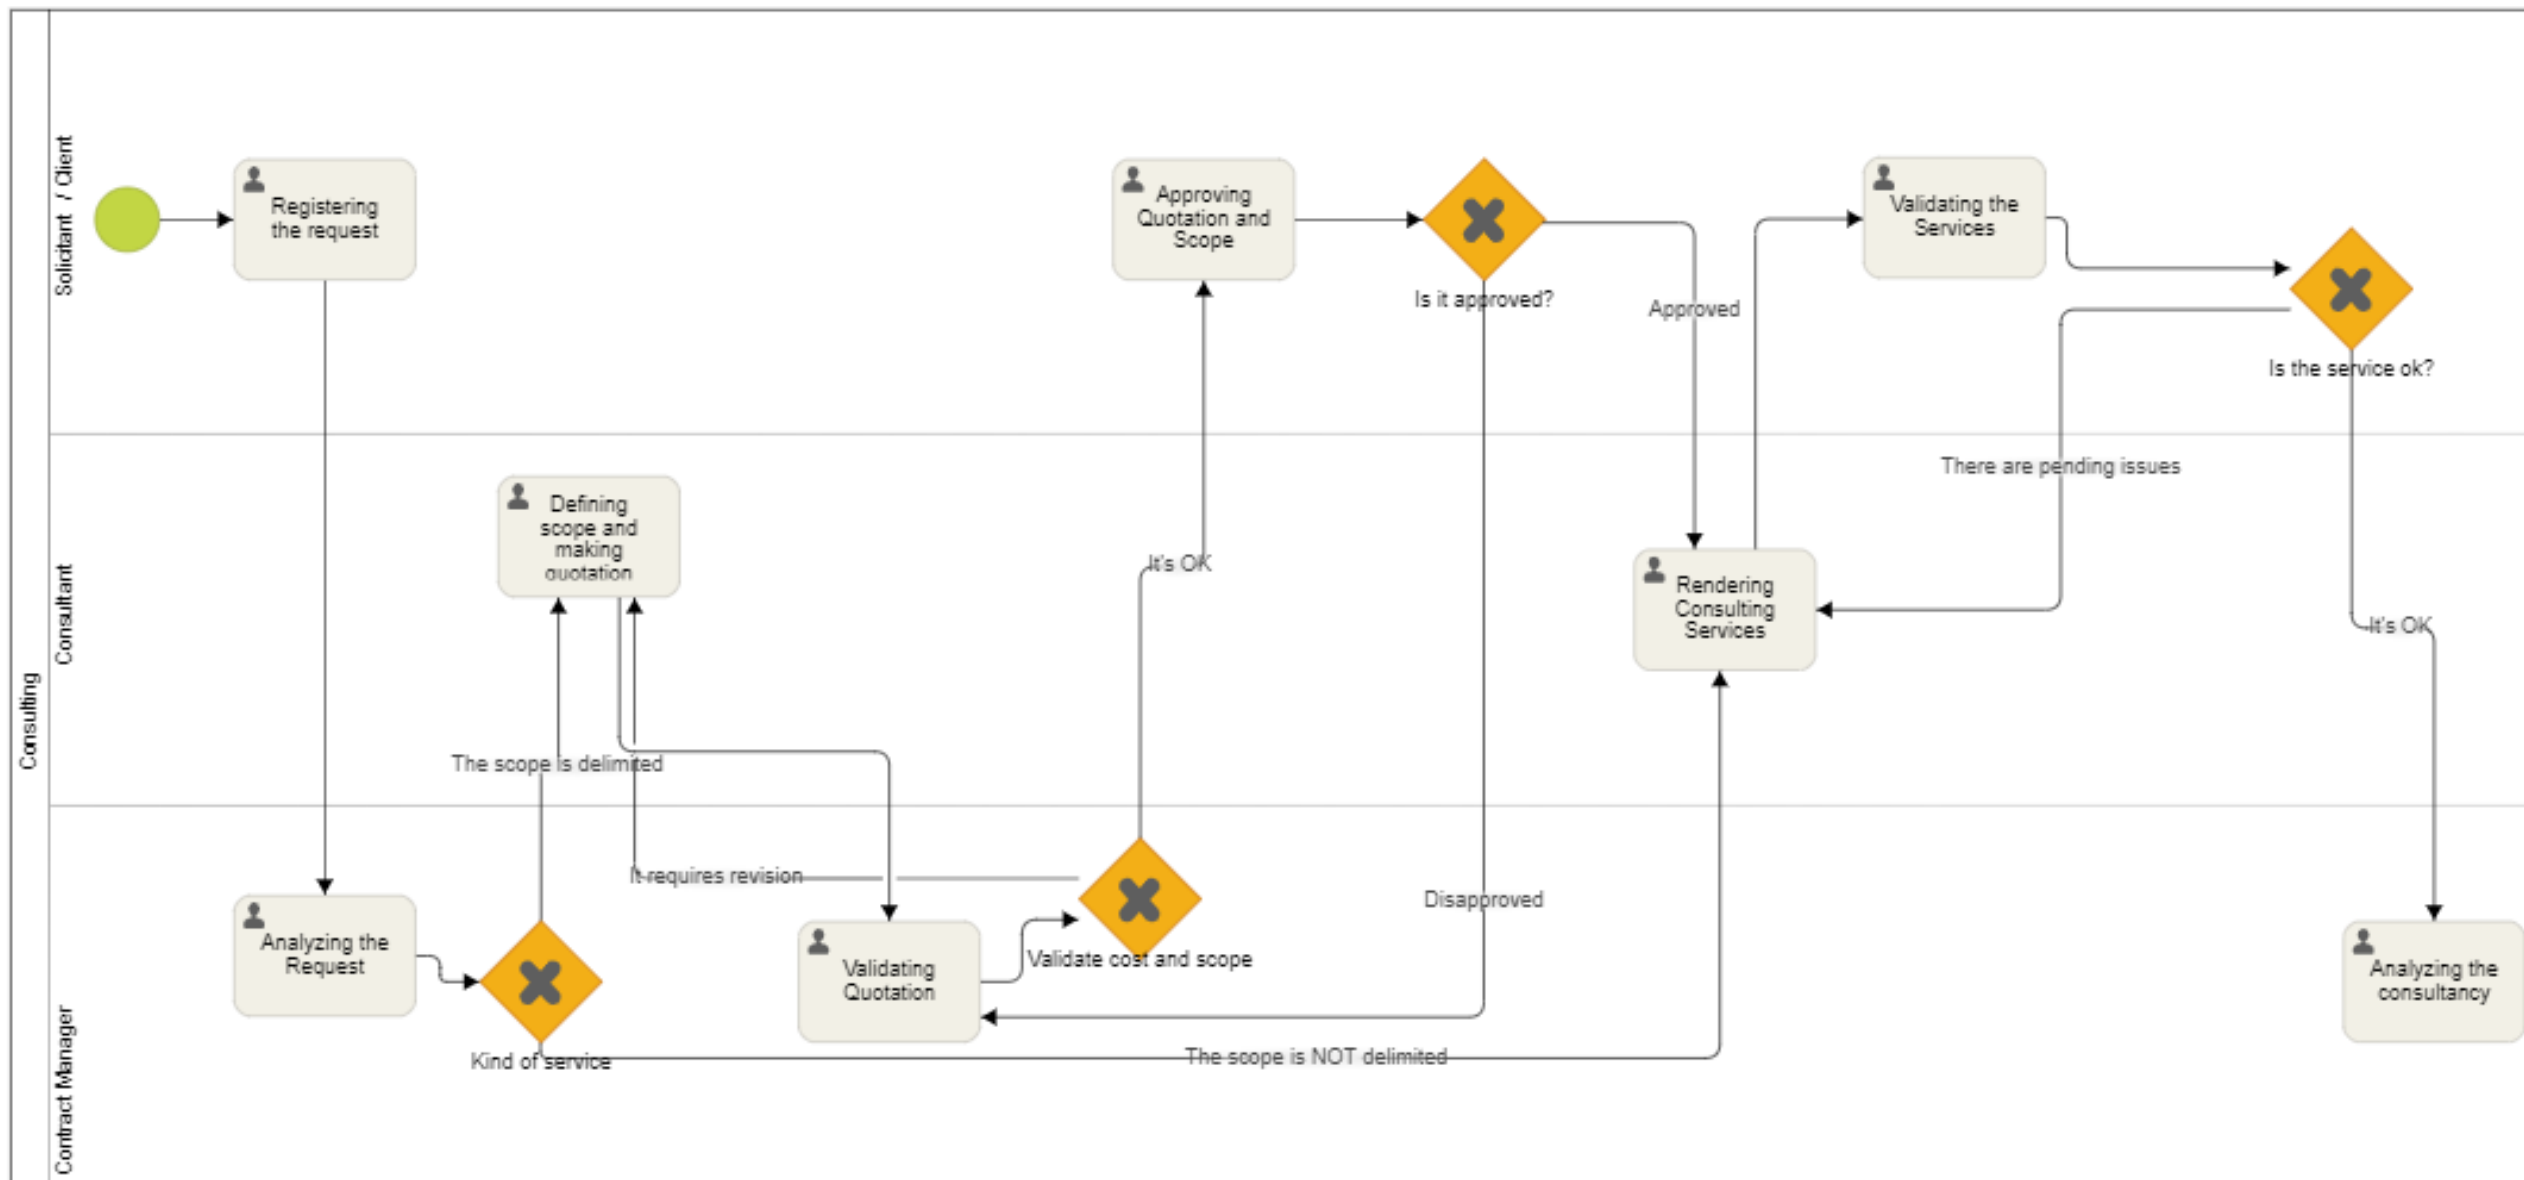

Interactions/Connections

- Sequence flows – determines the sequence of activities
- Message flows – messages between process participants
- Associations – associate text or data with modelling elements

Consulting Request Validation

Summary of Notations (so far)

3 kinds of flow objects

– Activity 

– Gateway 

– Event

Start

Intermediate

End

3 ways of connecting

– Sequence flow

– Message flow

– Association

Two types of container

– Pools

– Lanes (swimlanes)

Template-based

- static connection of “flow objects” or sequence relationship (predecessor and successor)
- similar to a river (upstream and downstream)
- process template is an abstract description of a process

Coordination Logic

Token-based

- token marks elements which active at a particular time
- dynamic connection of “flow objects” or synchronisation (wait for) / chronologic relationship
- similar to a “flock” of ducks (split and join)
- several tokens may co-exist

Event details

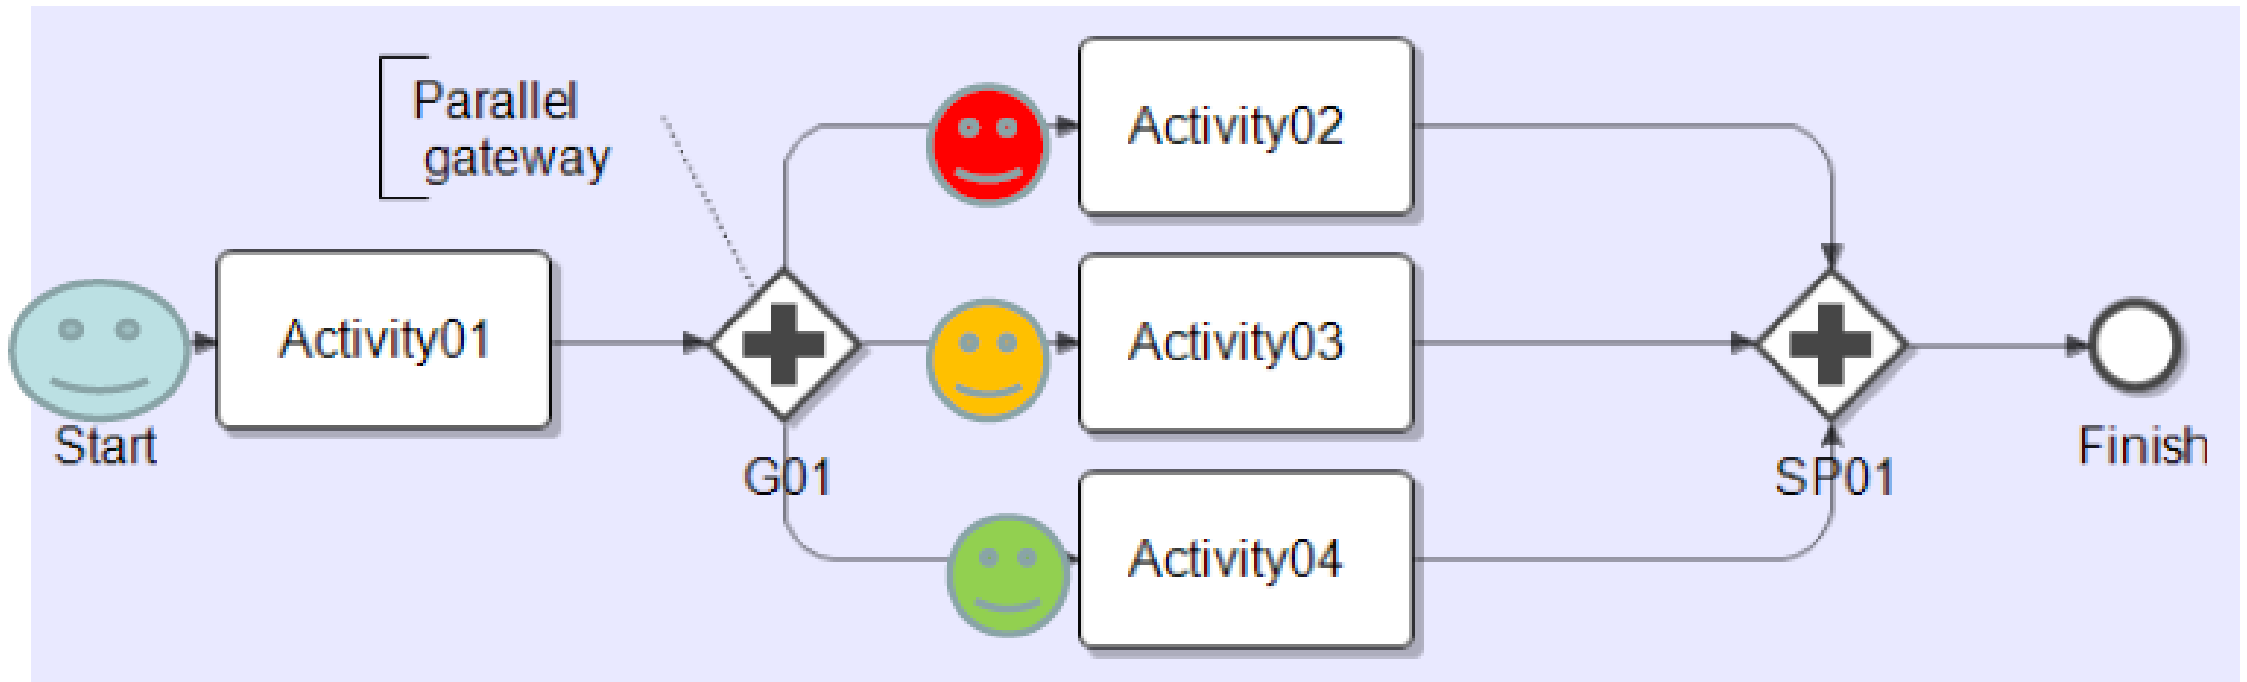

- Too many events details
- Recommendations to use:
 - Mainly “message”
 - Sometimes “empty”, “error” and “timer”

	“Catching”		“Throwing”	
Message				
Timer				
Error				
Cancel				
Compensation				
Conditional				
Link				
Signal				
Terminate				
Multiple				

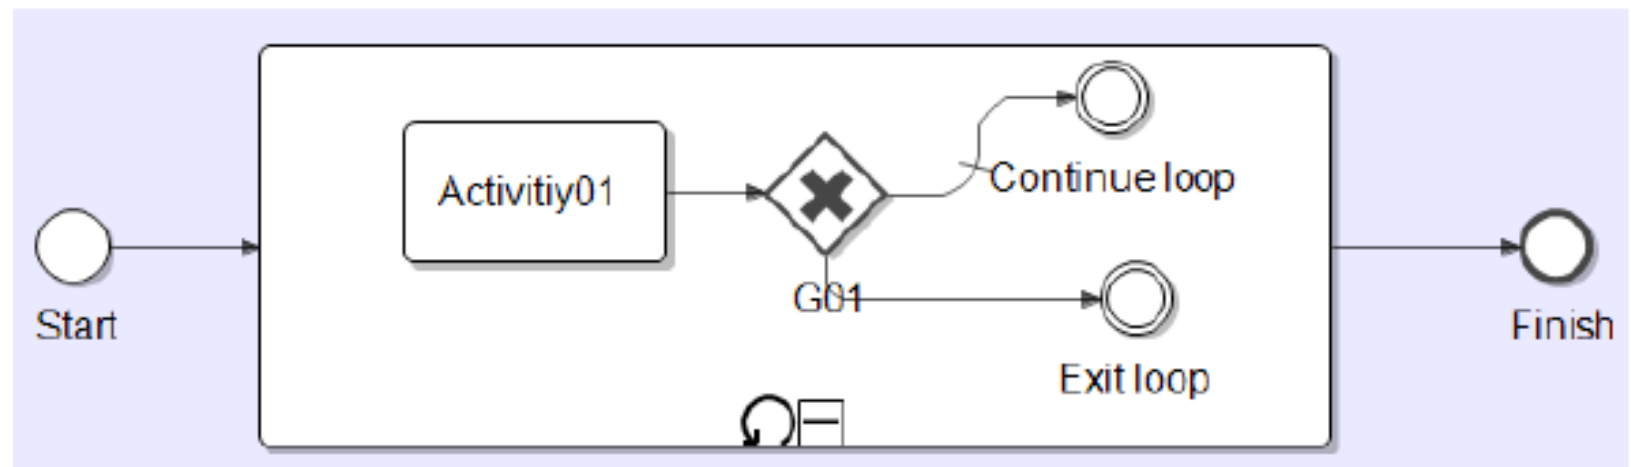

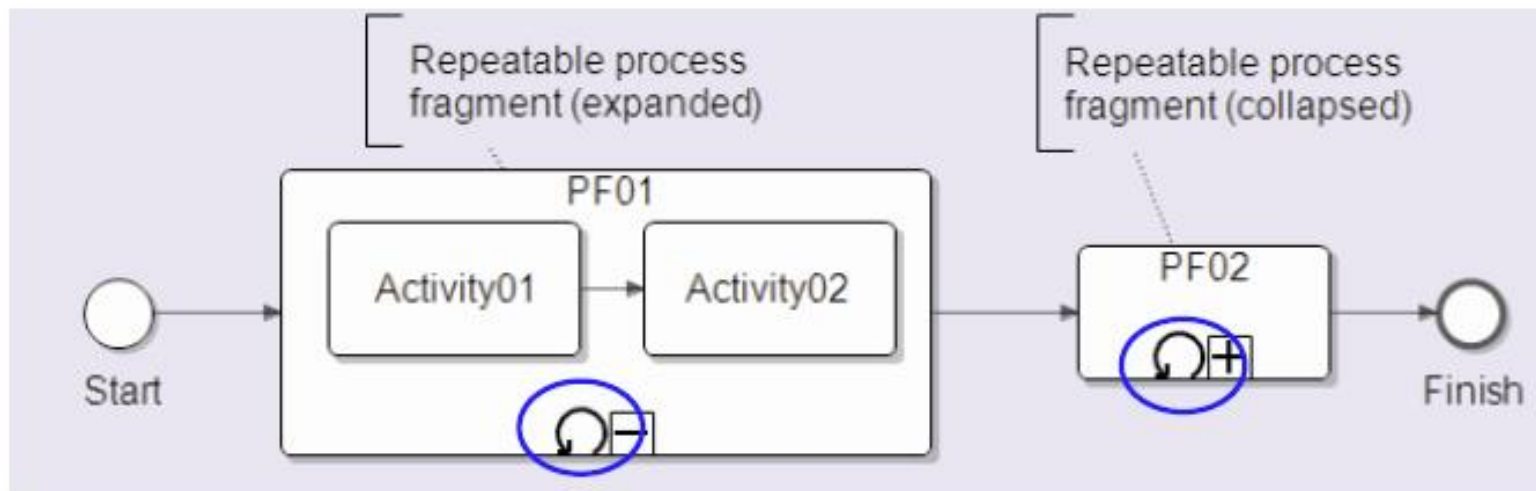

Gateway

- Gateway enables choice of a path – multiple parallel paths based on a conditional
- Activity choice influenced by check undertaken at the Gateway
- Gateway may be parallel: +; exclusive: x;

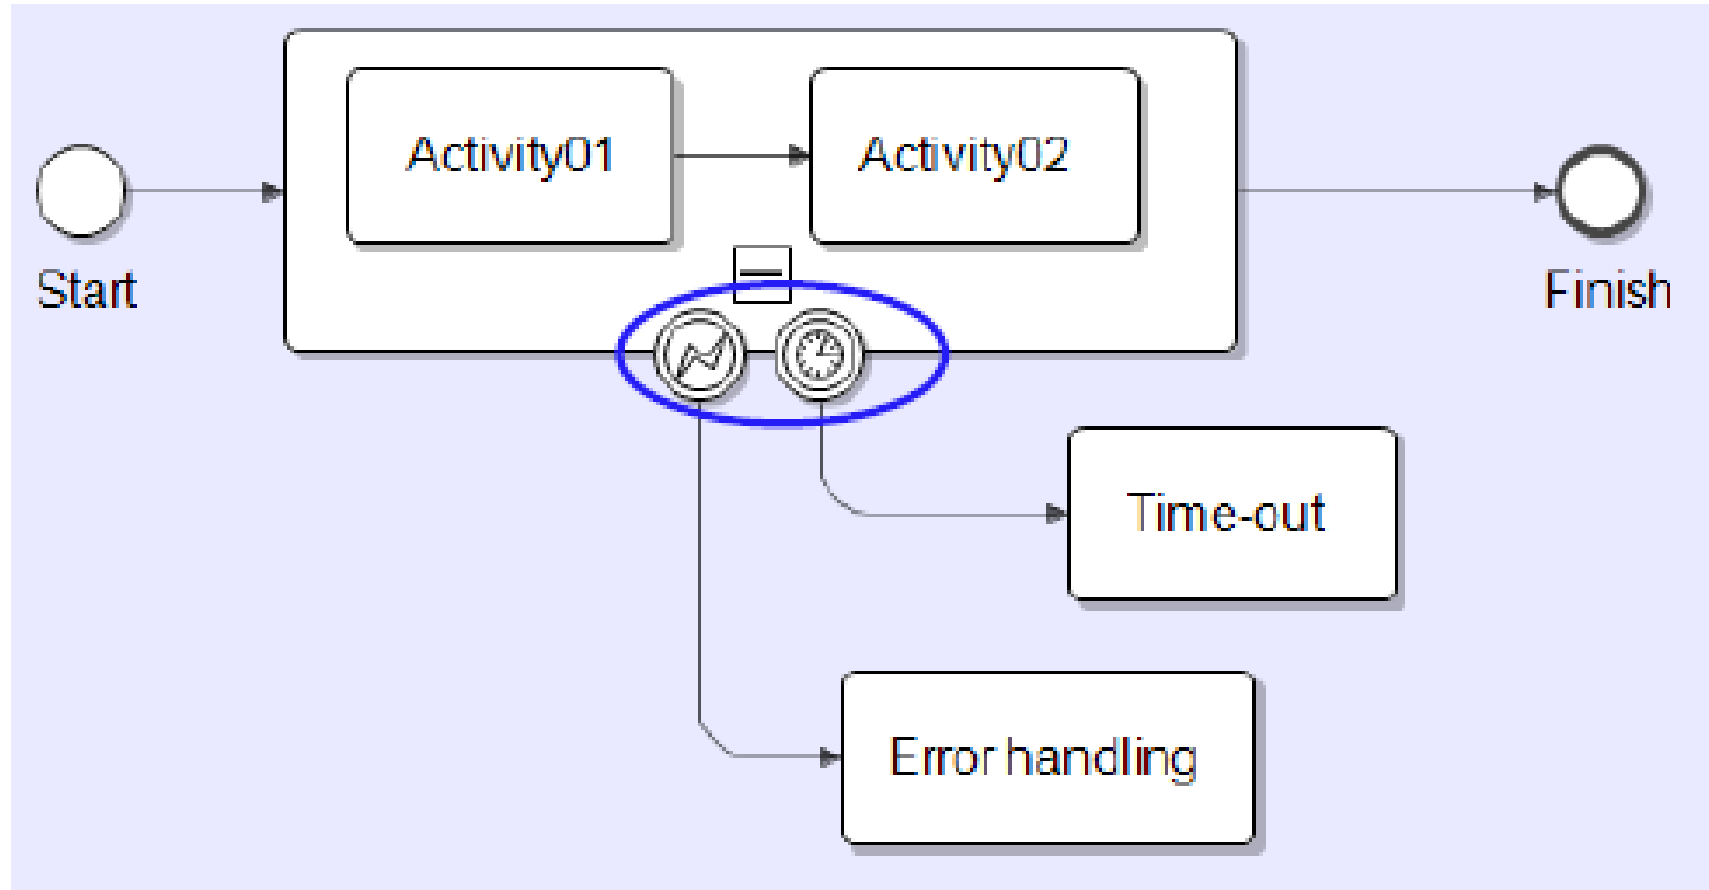

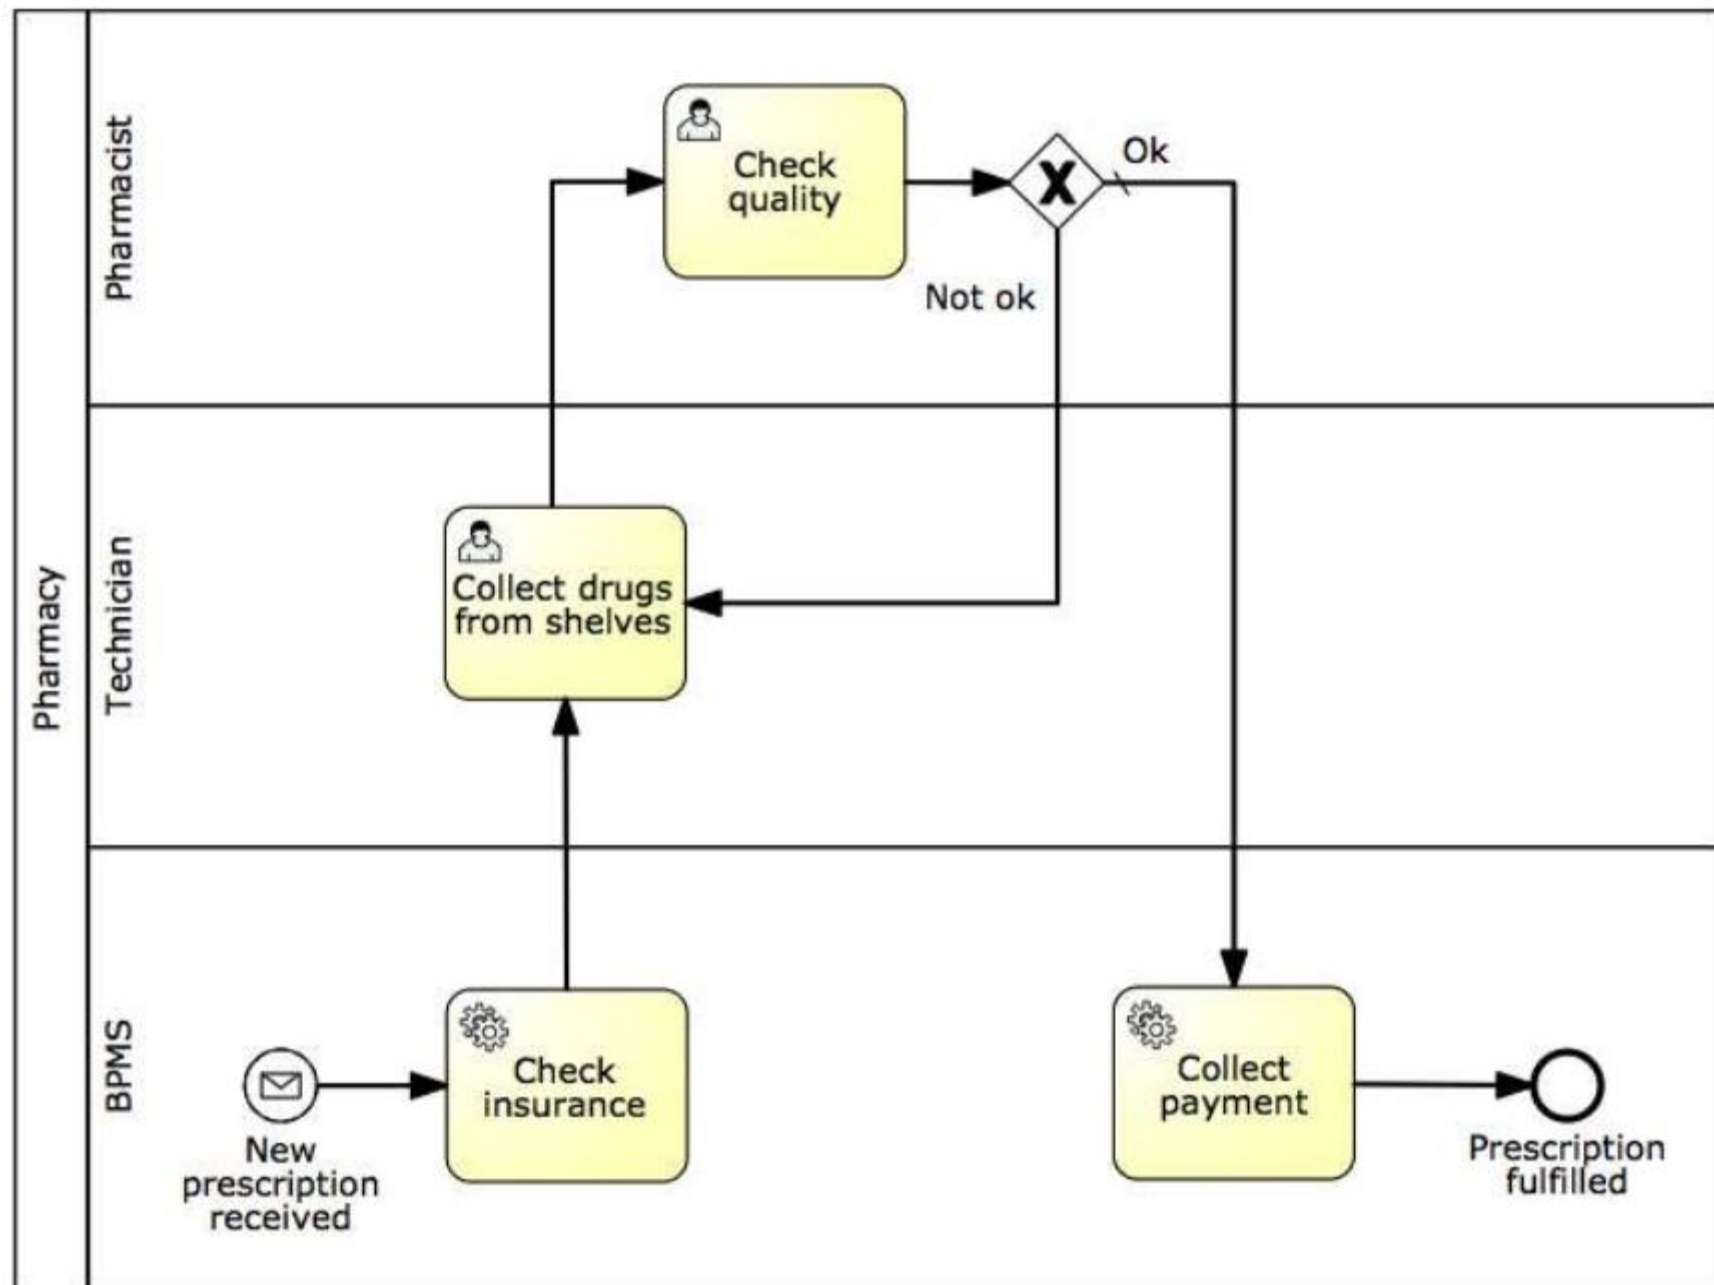

Process hierarchy + repeats

- Process fragments can be expanded or collapsed
- One fragment can be repeated

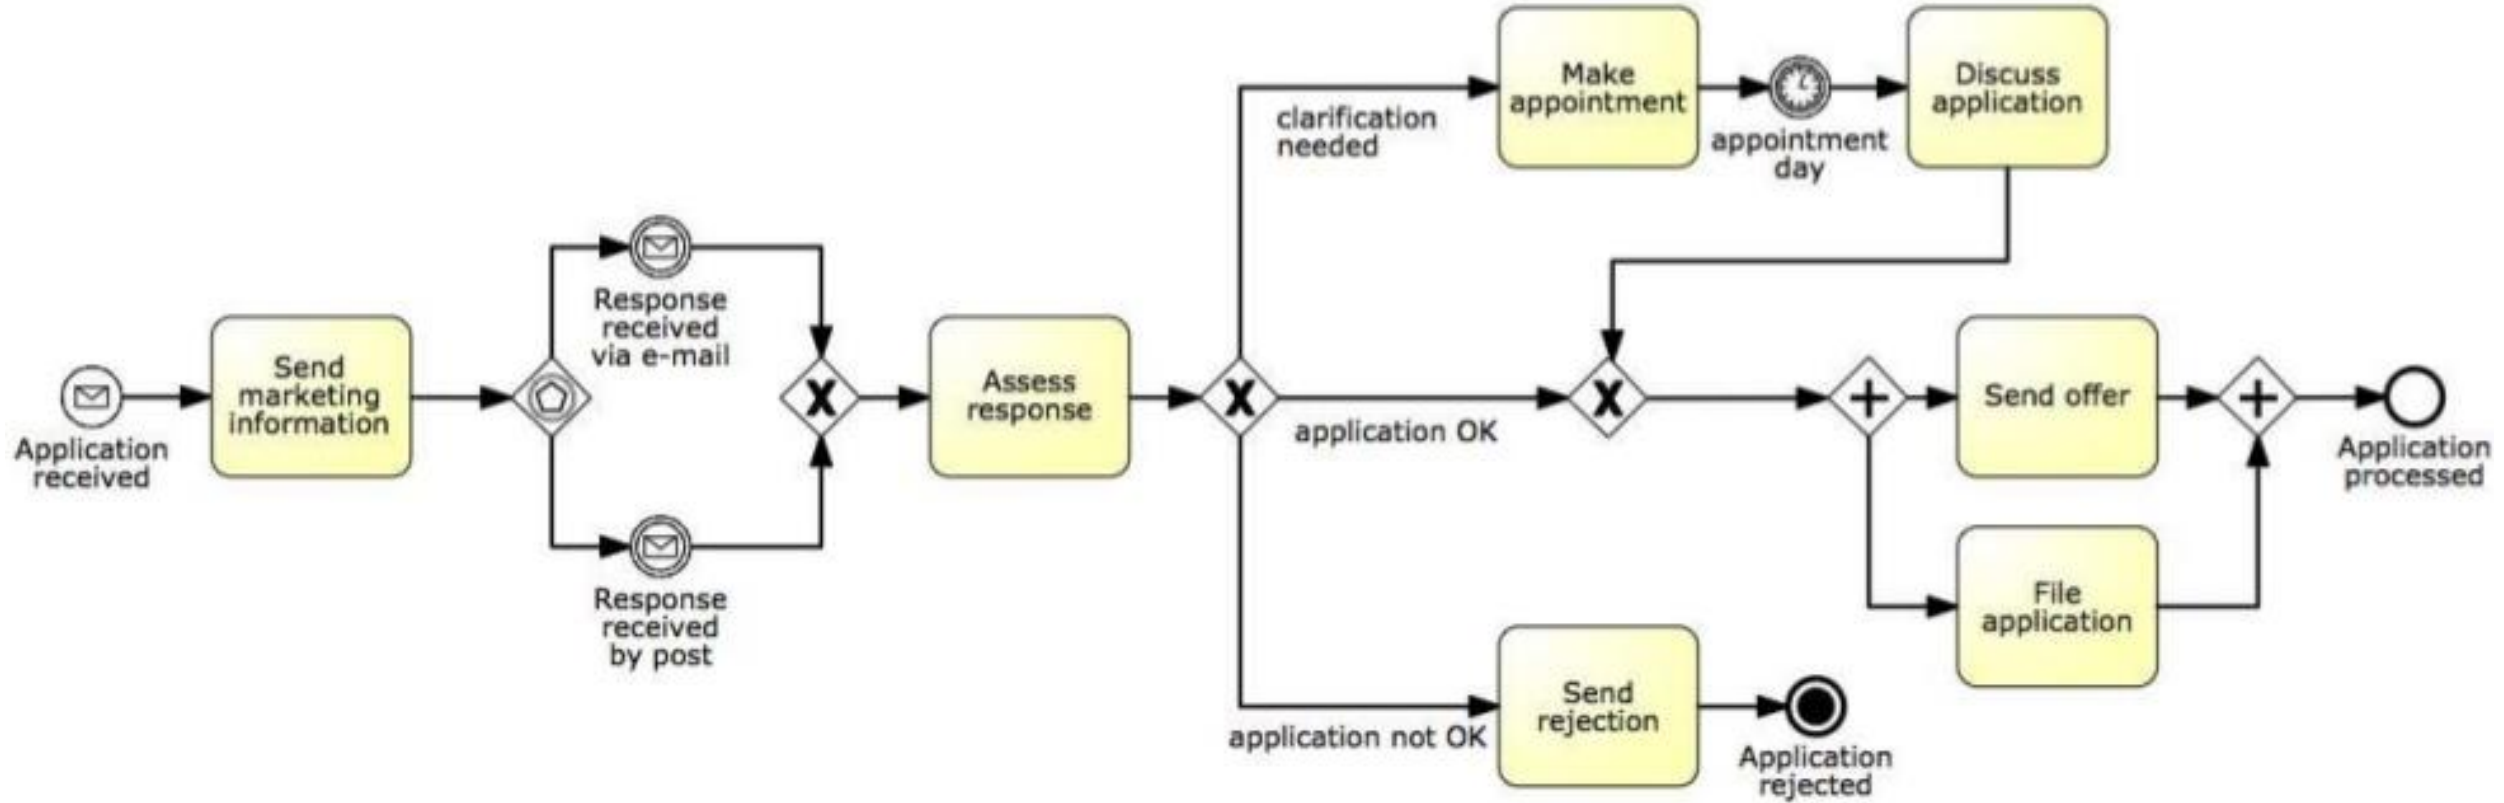

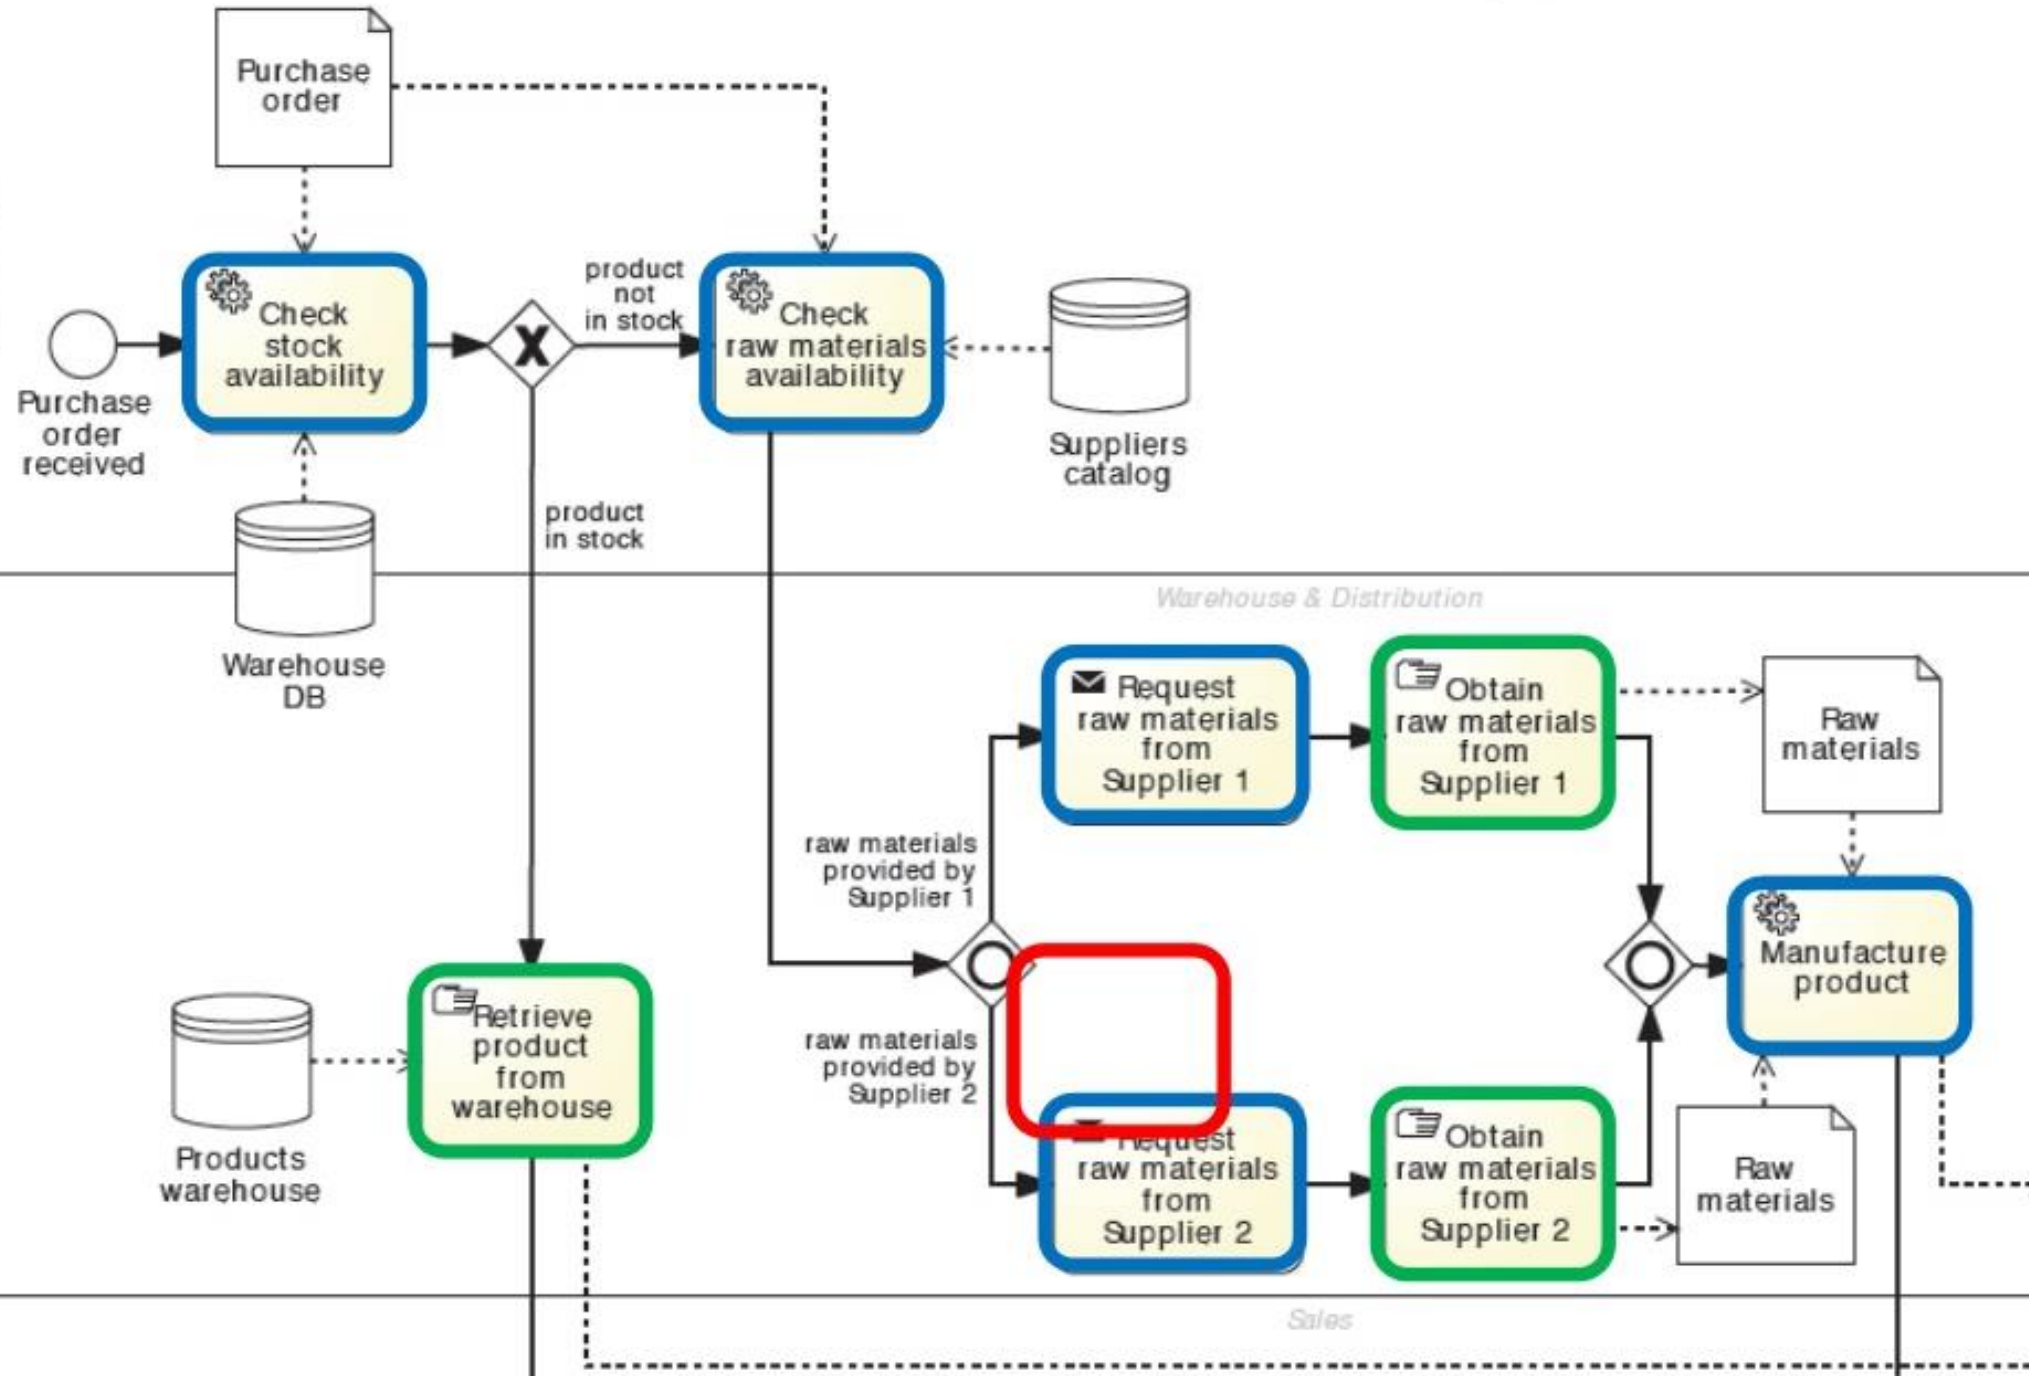

Errors & Time outs

Sales process for a B2B service

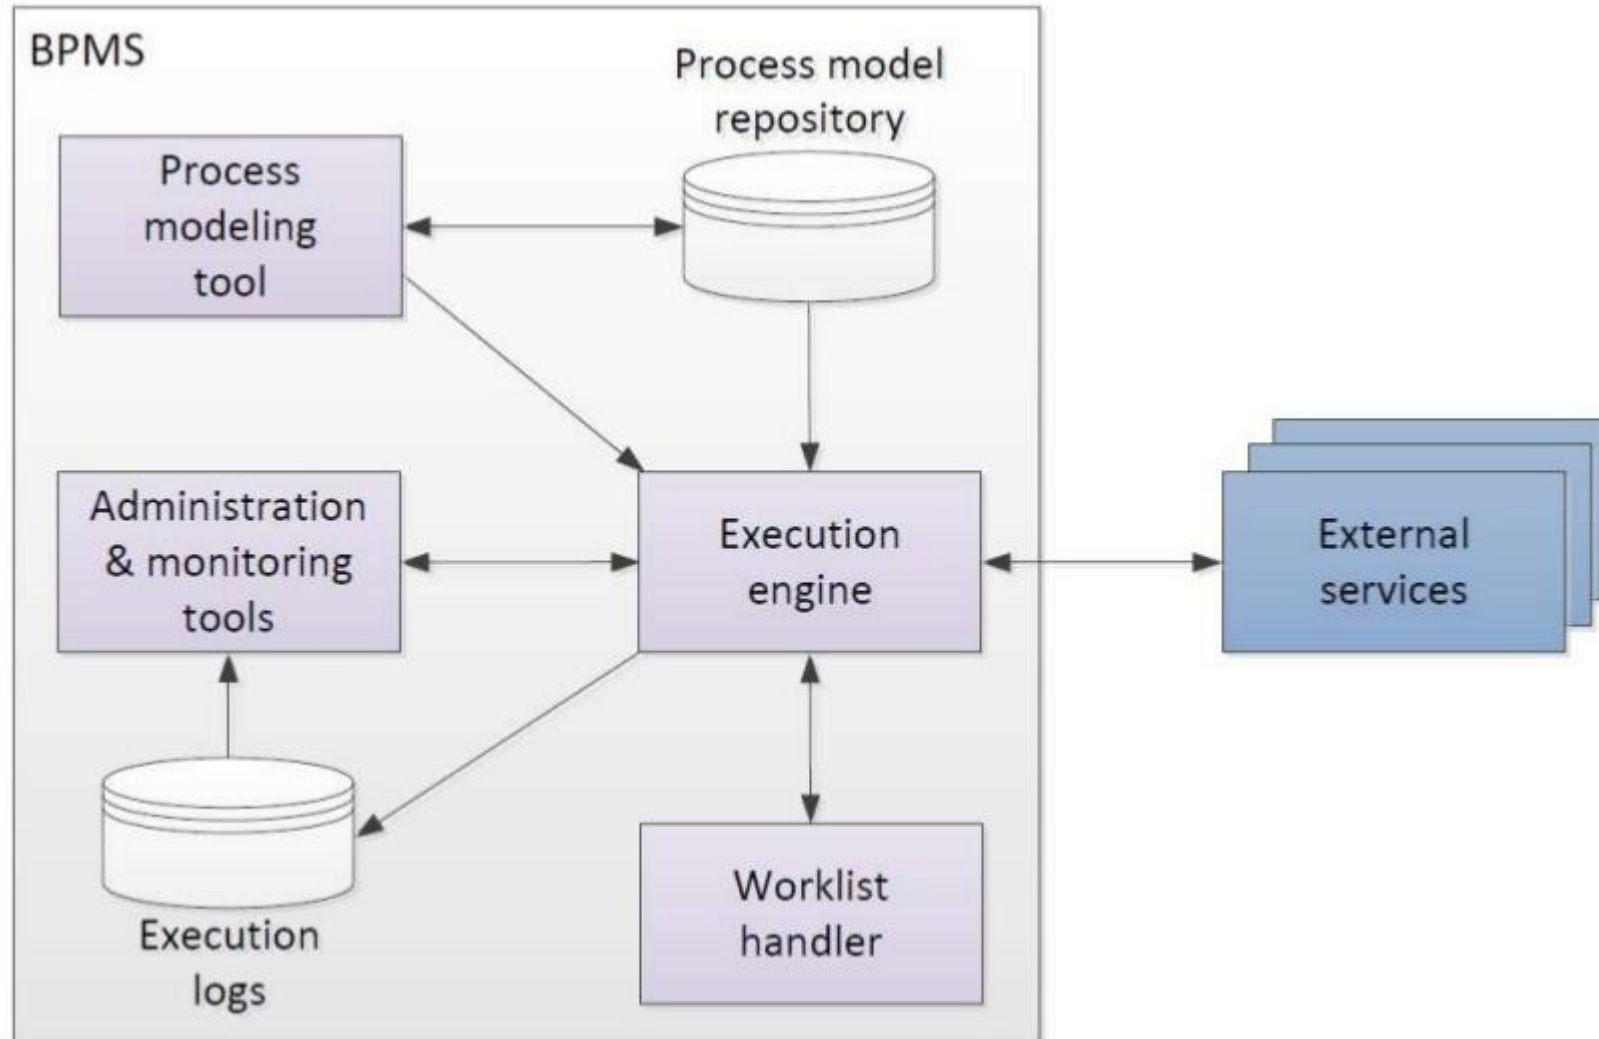

Business Process Modelling

- A number of tools available:
 - <https://www.bizagi.com/uk>
 - <https://www.bonitasoft.com>
 - <https://www.nomagic.com/products/magicdraw>
 - <https://bpmn.io/>
 - <https://www.heflo.com/tour-heflo-bpm/>
- Use a simple tool to get some experience/understanding:
 - <https://www.heflo.com/blog/process-modeling/bpmn-notation/>
 - YouTube Videos: <https://www.youtube.com/channel/UCSPgupeNPI-HGCKGGISip8w>
- Can be used via a Web browser – no download needed

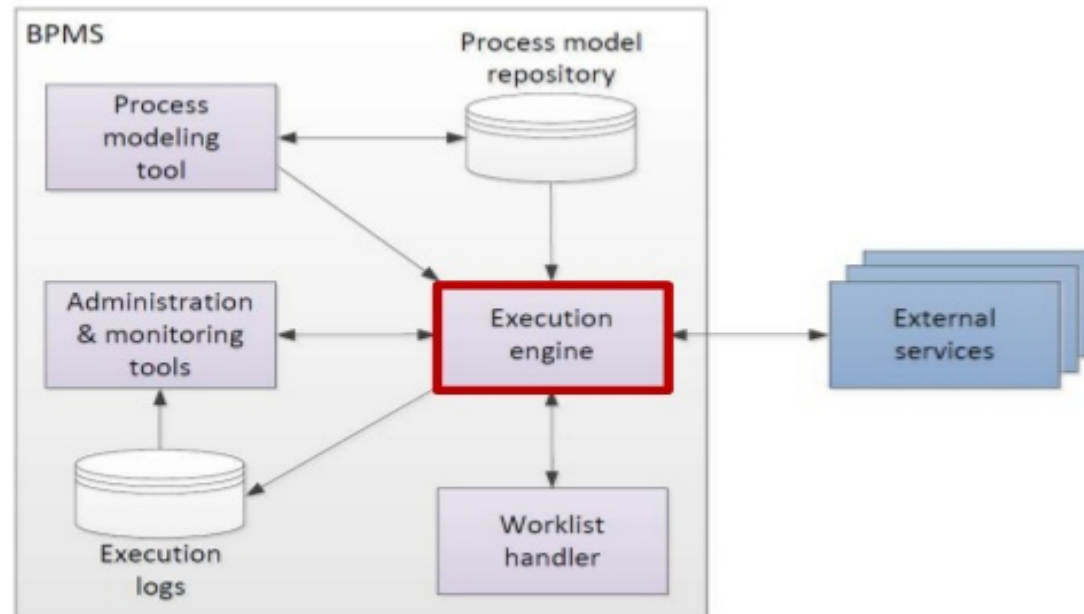

Business Process Management System

(Marcello La Rose & Marlon Dumas (QUT & UT))

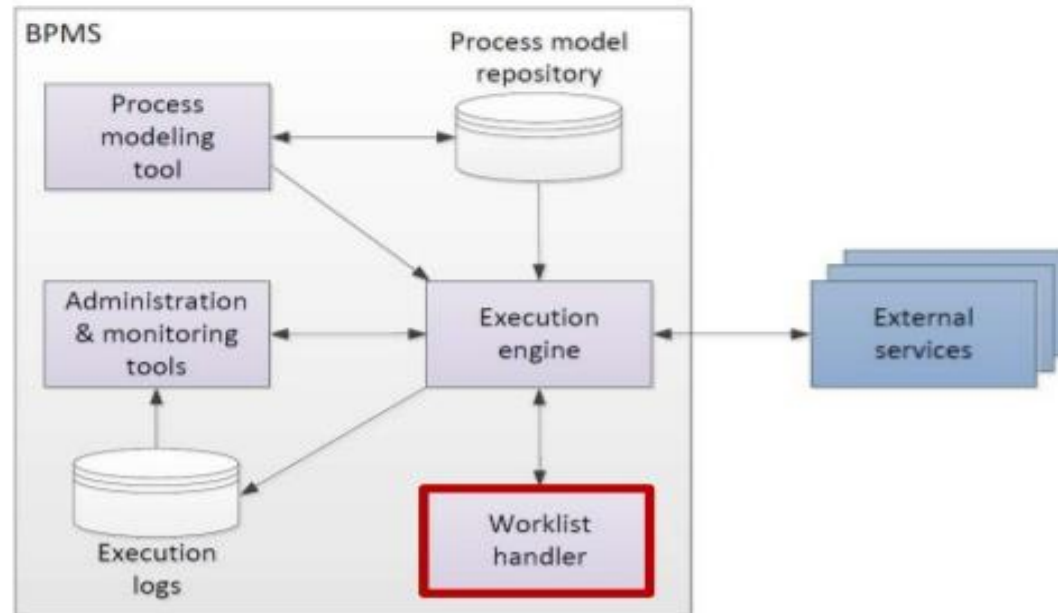

Execution Engine

- Instantiates executable process models (also called “cases”)
- Orchestrates distribution of work items to process participants and software services in order to execute a business process from start to end
- Logs execution data

Worklist Handler

- Imagine it as an “inbox”
- Offers work items to process participants and allows participants to commit to these work items
- Handles participants’ work queues and work item priorities
- May provide social network capabilities

Administration & Monitoring Tools

- To manage automation solutions
- To configure access to system components
- To monitor participants availability and performance of process cases

External Services

- Expose a service interface with which the engine can interact
- The engine provides the invoked service with the necessary data it will need to perform the activity for a specific case
- Examples: rules engine, email or Twitter notification, DB connector, CRM connector...
